Governor Miller spoke for a few minutes at the evening session. His attitude appears to be favorable to agricultural interests, and he has a better viewpoint than that of some who have occupied his position. He advised that farmers will have to work out their own problems of co-operation as well as of production. In the case of transportation the state may render some assistance.

George A. Cullen, was with the D. L. W. railroad when it urged the formation of the first farm bureau ever started in the country at Binghampton ten years ago. Then the whole idea was production; now it is quite largely marketing. Production must mean more dollars to the man. It has been found that our present system of distribution is wrong and co-operation is the remedy. To get all this to work well we must adopt a system of advertising. To advertise successfully there must be a proper system of grading.

Commissioner Hogue quoted twenty billion dollars as the crop production of the country. From five to eight billion is the loss to the farmers of the country due to the fall in prices. The purposely started deflation and banking attitude of the Federal Reserve Board at just the time when commodities went on the market in the fall might have been modified had commodities been ready to act quickly at the proper moment.

We have 1,640 agricultural associations in the state of which the Dairymen's League furnishes over a thousand. The farm bureaus and the Grange furnish the larger numbers of members the latter having 140,000.

C. R. White, head of the bureau of co-operation, gave many interesting items. He appears to be our leading authority on co-operative questions from a practical point of view. He thinks we are forming co-operative societies fully fast enough. He adds that strong contracts are necessary in the formation of societies, including penalties for breaking such contracts. New York is taking a leading part in matters of co-operation One of the best illustrations is that of the G. L. F. Exchange. This bids fair to do a business of ten million dollars in its first year of service. Agriculture, said Mr. White, stands a slim chance to meet organized business unless by well-supported co-operative associations.

The resolution committee came forward with a good grist, indicating that there is a real live interest in agricultural affairs and that there is confidence in the state society. Some tinkering with the automobile laws has been proposed such as bonding owners of all cars and licensing all who drive cars. These are not in the interests of farmers nor of economy, and the resolutions oppose them. Additional constabulary in country districts was favored. The changing of trespass laws to require the permission of owners if one desires to hunt was favored. The question of health centers at public expense in isolated rural districts was given discussion and the resolution favoring it passed. Economy measures suggested by Governor Miller were approved and consolidation of departments was favored. Elimination of unnecessary bureaus or departments and the readjustment of the budget system met sanction. I was particularly pleased that the association, like some of the others, this winter, came out squarely in favor of milk producers and the pooling plans of the Dairymen's League.

Officers for the coming year are: R. T. Wainwright of Rye, president; A. L. Brockaway of Syracuse, secretary; and Harry R. Winters, Albany, treasurer. In addition nine vice-presidents for the nine districts of the state were chosen.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, Feb. 14—The controversy over the adulterated butter ruling of the Commissioner of Internal Revenue is not as acute as during the few days immediately subsequent to the issuance of the ruling and its accompanying tax decision as there is a lull which normally precedes the storm sure to break in the hearing which the Commissioner has agreed to give on Feb. 25. This hearing bids fair to bring together a big representation of every branch of the dairy industry from the representatives of the breed associations and the milk producers up to the representatives of the machinery interests which manufacture the tools used in the butter making business.

The American Farm Bureau Federation, on the motion of the Illinois Agricultural Association in the first place, later on joined by the state federations in several of the dairying states, have asked to be heard and have filed a protest against the ruling.

John D. Miller, chief counsel of the Dairymen's League and vice-president of the National Association of Milk Producers, and also Milo D. Campbell, president of the latter organization, have already taken steps to investigate the situation, in both its legal and technical aspects, and will ask to be heard at the general hearing. These are in addition to the regular representatives of the various creamery organizations at whose instance the hearing is to be held.

Discussion of the Attorney General's opinion, given in answer to the questions asked him by the Secretary of the Treasury, and of the consequent ruling of the Commissioner of Internal Revenue revolves around the wording of question No. 2, in which he is asked as to the effect when the neutralizer is used with cream "high in acid and of a bad odor". The words in quotation marks are the ones in question, for the words quoted do not appear anywhere in the butter law. It is contended that joining the idea of high acidity with the idea of bad odor led the Attorney General to connect the two ideas as cause and effect, and to rule that the use of a neutralizer to overcome a high acid condition is equally to be penalized with the use of a neutralizer to overcome bad odors, specifically mentioned by the statute as adulteration, and in line with and equally obnoxious under the statute on the use of a neutralizer or other chemical to "remove rancidity". In other words, these analysts contend that by the form of this question the Attorney General was induced into making a ruling which while in the main it adheres to the reasonable interpretation of the statute as to the adulterating effect of chemicals if used to remove rancidity or to deodorize, proceeds far beyond the clear intent of the statute, and holds also that the counteracting of a high acid condition is also adulteration, within the meaning given by the Attorney General to the statute, while as a matter of fact, and as a matter of clear meaning of English as used in the statute, this is not the case.

On this hypothesis, the commissioner will be asked not to withdraw his ruling, and thereby give the public the impression that the dairy industry wishes the bars against bad butter let down, but to amend or modify his ruling so that the tax penalty shall lie against only that grade or grades of butter made by the use of some acid or alkali or other chemical in cream to "deodorize or remove therefrom rancidity", which is the exact wording of the law. This, it can be said in advance, is about the position in which the representatives of the larger dairy interests, the Dairymen's League, the National Producers' Federation, and the breed associations will probably be found to take when the hearing is held.

The decision of the Maryland-Virginia Milk Producers' Association, which supplies the national capitol with milk, to own and operate its own surplus milk plant, carried with it a broader program of work than was indicated. The plan, adopted without opposition and by a practically unanimous vote, calls for the organization of a stock company with $100,000 capital stock to equip the plant and provide working capital stock subscriptions to be asked from all association members on a basis of his annual sales through the association. Dr. Harvey W. Wiley, former president of the association, took the first $500 sold. The use of the proposed milk plant as an association laboratory and testing station, in the minds of many of the association members, outweighs even its utility as a place to handle the surplus. This

Ohio Farmers' Round-Up

CLARENCE M. BAKER, OHIO

OHIO has passed the 9th Annual Farmers' Week, which is frequently called the "round-up", for it brings together practically all the farm activities of the state for one entire week of educational work. The first few events of this kind held by the Ohio College of Agriculture were of the plain educational-give-out type, in which it was believed it was necessary to pass out a certain amount of information to satisfy the people registering for the event. The ninth one, however, was a combination, in which the scientific man presented his data and drew his conclusions, while the practical farmer followed him in discussion and application of the same problem on the average Ohio farm.

Ohio's Farmers' Week is always operated on a full schedule; the farm woman, the poultryman, the soilsman, the annual husbandryman, and the cropsman all having features that make it possible for any one to secure a well-rounded system of facts from any of the series.

Dairymen are Confident

Among all Ohio farmers, the dairymen seem to be the most contented with their lot and in the best shape to meet the future. The price of milk has not been reduced to any large extent; while the price of feed has resumed almost a pre-war basis, thus making the dairy income quite satisfactory. The grain farmer of western Ohio has immense quantities of corn which cannot be moved easily and sells at a very low price. Organization has been responsible for placing the dairymen on a sound basis.

Peter Small, the veteran breeder of high-producing cows in Ohio, in addressing the dairymen, called attention to the fact that high producing cows must be fed individually, care being taken to determine the demands of each animal. Keeping the feed palatable is one of the points Mr. Small emphasizes—by using molasses mixed with dried beet pulp—to increase the palatability of feeds. He believes, too, that a different management in the housing of cows will aid in getting larger production and feels that an open shed where cows can exercise and have plenty of good water is superior to keeping them housed entirely in a box stall during high producing tests. He feels that getting cows into extremely high condition before going on the test is not always best as more average conditions are generally desired. Mr. Small's work in breeding high producing cows has resulted in an average production of 684 lbs. of butterfat for five generations of animals.

Poultry Activities

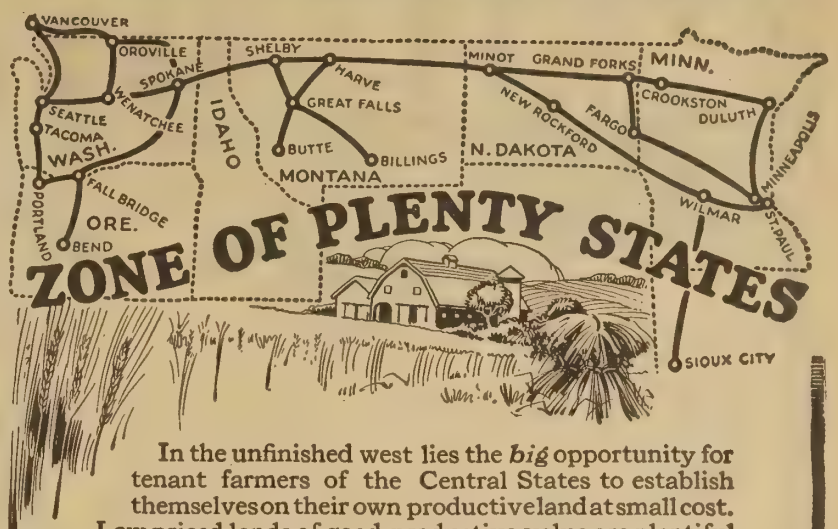
Ohio is taking an unusual interest in the development of her poultry industry, if the sidelights of the poultry program at Farmers' Week can be taken as an indication. Through a system of record keeping, the poultry department at Ohio State University is keeping tab on hundreds of flocks in the state and from this work presents many features of successful management.

Probably no other point has contributed so much to the production of winter eggs as the use of electric lights in the laying house. From experiences given at the poultry sessions it was found that many farmers were securing from 40 to 50 per cent production from their hens during the winter and have received from 80 cents to $1.00 a dozen for eggs in Cleveland, Buffalo, and New York markets. The system of lighting generally consists in an automatic alarm clock arrangement which turns the lights on in the hen house at 3:00 a. m. in the morning. In some cases farmers are using the evening lunch system; lights are turned on the hay-

"WORKING AHEAD OF THE PEAK SPRING LOAD" ON PABST STOCK FARMS, WISCONSIN, BY SPREADING LIME DURING THE WINTER MONTHS. EIGHTY ACRES HAVE BEEN COVERED WITH FIVE TO SIX TONS OF LIMESTONE PER ACRE

ing hens at 8:00 o'clock in the evening. At this time the hens jump from the roosts and they are given a heavy grain ration and plenty of water to drink.

Experimental results in poultry production are kept before the poultrymen of the state in such a way that the use of some animal protein is regarded necessary by nearly every successful poultryman. Most of the mash rations used in feeding poultry contain 15 per cent meat scrap or tankage, or their equivalent in sour milk, skimmilk, or buttermilk.



With the Swine Men

The swine people of Ohio believe, too, that there is strength in organization, for almost half of Ohio's counties have complete Duroc-Jersey county swine organizations. Other breeds of swine are also well represented and many of the problems of the swine grower are being looked after through these organizations.

John A. Evvard, of the Iowa Experiment Station, probably drew the largest swine audience ever at any Ohio Farmers' Week for his talk on experimental hog feeding. It developed from his work that there are several new points of interest to the swine feeder. First, that milk acts as one of the protective feeds, supplying needed protein and in most times the

(Continued on page 245)

Own Your Own Home

In the unfinished west lies the *big* opportunity for tenant farmers of the Central States to establish themselves on their own productive land at small cost. Low priced lands of good productive value are plentiful in Minnesota, North Dakota, Montana, Washington and Oregon—the proved Zone of Plenty states.

Whether you go in for stock-raising, dairying, diversified farming, grain or fruit growing, you will find what you want in the Zone of Plenty states. The Great Northern Railway, agricultural development department, will help you get located, willingly, reliably, quickly and without charge.

Know the Zone of Plenty States

Minnesota

In central and northeastern Minnesota, cut-over lands offer splendid opportunity for diversified farming, grain growing, dairying and potatoes.

LOW PRICES. Clover and cows will support the family while the land is being cleared. The Red River Valley, Western Minnesota, contains vast areas of rich, black soil where all kinds of grain, corn, alfalfa, clover and live stock are successfully produced.

North Dakota

North Dakota has available for settlers largest body of rich, black, low-priced lands in the United States. Fields smooth, easily farmed and well adapted to tractors. North Dakota is booming as a stock-raising state. Wheat, small grains, alfalfa, red and sweet clover are money-making crops.

Montana

Millions of acres of grain-growing lands at low prices, on favorable terms, are available in Montana. This state has exceptional stock-raising advantages combined with grain-farming. Big production insured by irrigation. Dairying, diversified farming and fruit growing are proving successful on Western Montana cut-over land. *On small capital you can make a substantial start here.*

Washington

Washington and northern Idaho offer a wide range of farming activities. Low priced lands produce good crops of grain, forage and vegetables. Dairying and mixed farming profitable. Building material and fuel cheap. Water abundant. Climate delightful. Commercial fruit production highly developed under irrigation.

Oregon

Oregon, with its attractive climate, offers vast farming possibilities. Low priced irrigated land east of mountains. Diversified farms, west of mountains, produce fruits, berries, mixed crops and dairy products.

Do Not Delay Getting the Facts

It is practically impossible for a man of small means to get started today in Illinois, Ohio, Wisconsin, Iowa and Nebraska because of the continued advances in land prices in these states. Let us help you to your own home in a rapidly growing country where the future is resplendent with promise. Fill in attached coupon and mail today. We will reply promptly, giving you necessary and helpful information. Don't stop there. If you want additional information, write us. We are on the job to help you.

These Seven Cows

Fed From the Product of One Acre Every Day for Over a Year

64 tons of Ross' Eureka Silage Corn to the acre is the yield reported by Mr. Reynolds, Farm Superintendent of the Worcester State Hospital, Massachusetts. At 30 lbs. each per day, this would feed seven cows for one year and eight months.

Ross' Eureka Corn grows the tallest, has the most leaves, is very short jointed and will produce more tons of good sweet ensilage per acre, than any other variety. We have been selling Eureka corn for nearly 40 years and we know before shipping that it will grow under favorable conditions. This corn usually germinates 90 per cent. or better.

Ross' Eureka Corn

Complete line of Farm Seeds: Oats, Rye, Barley, Wheat, Buckwheat, Cow Peas, Vetch, Soy beans, Essex Rape, all varieties of Field and Ensilage Corn, Grass Seeds, including all kinds of alfalfa and Sudan Grass. Also full line of Agricultural Implements, Poultry Supplies, Fertilizer, etc. Our 120-page catalog mailed free on request.

ROSS BROTHERS COMPANY, 55 Front Street, Worcester, Mass.

BUILT FOR DURABILITY

CP Xtra-strong Milk and Cream Cans

are famous the country over for long life and accurate measure. They are heavily tinned from pure block tin after stamping. All joints are loaded with solder and the interior is absolutely smooth. There are no bacteria harbors. Neck and breast are joined on a powerful press in a perfect grip-lock joint, watertight before tinning.

The Climax can shown herewith is a splendid can for wagon use, for delivering milk and cream to the creamery, etc.

Milk: A Problem for the Woman Voter

JENNIE M. TURNER, WISCONSIN

MILK is like water. Everybody uses it daily. It is essential to the health and welfare of the race. Its limited use, like the limited use of water, is a sign of a low stage of civilization. Its pollution, like the pollution of water, is the cause of many of our most dangerous epidemics.

Women of Wisconsin, as elsewhere, have in general neglected what would seem to be peculiarly the problem of a clean and economical housewife, namely, the insurance of a steady supply of pure milk at reasonable prices. They have spent much time upon the more superficial phases of the marketing problem, such as the public market. They have given little attention to the more fundamental subjects of cost of production, the broader aspects of marketing, and standardization of either milk or other products.

The efforts of the women of Madison, Wis., to secure a pure milk supply at a reasonable price are probably typical of the activities of women throughout the state. Club women of Madison have given some study to the milk problem. Their study has had three main results. First, those who are able to afford it buy exceptional milk above the regular market price for their own children. Second, those who feel some responsibility for the welfare of the children of others obtain ease of conscience through contribution to the fund for the free feeding of under-nourished school children. Third, there is a very significant report by the Milk Committee of the Madison Woman's Club.

The first two accomplishments dodge the real issue. They present no fundamental solution of the problem of good milk at reasonable prices for all. The report offers a real solution. It suggests various alternatives, including the establishment of a farmers' co-operative concern, the establishment of a municipal plant, and the establishment of a combination producer-consumer co-operative plant. The report concludes with this statement:

"The two features which stand out as absolutely essential in any scheme which will effect a real economy and benefit to both producer and consumer, are monopoly and standardization. The greatest wastes in the business are due undoubtedly to its competitive nature. The existence of a monopoly would eliminate these wastes, and would make much easier a thorough standardization of milk. The system of trying to raise the quality of milk by inspection is futile unless we have an army of inspectors. The only businesslike method of raising the quality of milk is to grade it carefully according to bacteria count and butterfat, and *pay more* for the clean milk and the rich milk than for the milk of poor quality."

The report points out the difficulties of co-operation and the impossibility of municipalization without legislation.

Legislation was attempted in 1919. The following bill was passed and vetoed by the governor:

"Every city, however organized, is hereby authorized and empowered, by a vote of a majority of the members of the common council, to establish and operate depots and plants for the purchase, preparation, or manufacture and distribution of milk and all other dairy products, including buttermilk, skimmilk, cheese, butter, and ice cream."

It is questionable whether this bill, if it had become a law, would have accomplished the purposes which municipal control of the milk supply should accomplish if it is to be any better than private control. Among these purposes are the following:

First. It should compel standardization of milk. The consumer should know what he is buying, how much butterfat, other solids, and bacteria; and the farmer should know what he is selling. *The consumer should pay for what he gets, and the farmer should be remunerated in proportion to what he gives.* The farmer who brings in milk with a high fat content and a low bacteria count should be rewarded in proportion to the food in the liquid, and not simply paid a flat rate for any kind of a liquid that looks white and is called milk.

Second. The city should assure itself a safe, good, continuous milk supply by steadily fair treatment of the milk producers.

Third. There should be continuous pressure upon producers to improve the quality and reduce the costs of production of milk, and upon the city plant to do its work as efficiently and to reduce its costs as much as possible.

Fourth. Duplication in delivery systems and routes should be absolutely abolished.

Fifth. Producers and consumers should be brought into frequent or continuous contact for the purpose of educating each upon the problems and needs of the others.

To accomplish these purposes a state law which would embody the following or similar principles might be suggested:

First. The state marketing department, with the aid of the state dairy and food commission and of an advisory group made up of experts of milk producers, milk distributors, and milk consumers, including women, should fix standards by which milk shall be bought and sold in the state; allowing local milk dealers, whether private or public, to use for the purchase and sale of milk some or all of the various classes created by these standards.

Second. Cities shall be given the right to take over the entire distributing system; to buy out at a reasonable value, all plants and equipment engaged in the preparation and distribution of milk, say at the time of the passage of this law and continuously thereafter until the taking over of the business.

There is utter chaos in our present method of marketing milk. Every dairyman who wants to can start up a little route of his own in the city. By cutting in upon some other dairyman's route, and creating duplication and scattered routes he runs up the costs of the other. The more distributors the greater the costs of distribution. The consumer is helpless to control these extra costs due to duplication. The distributors, on the other hand, are helpless to cut down the costs for which the consumer is responsible, such as destruction of bottles and bad credit. These costs of carelessness and dishonesty cannot be cut down until competition is abolished in the distribution of milk, so that the milk supply can be shut off just as the water, gas, electricity, and the telephone can now be shut off from the offending customer.

Third. Cities should be given the option of running the business as municipally owned utilities are now run, or of trying a new method, by which the board of directors of the plant would not be the city council or merely city residents appointed by the council, *but would be representatives of consumers, producers, and employees.*

May we not find in this provision

the secret of securing efficiency without autocracy in the management of some of our marketing facilities under a system of public ownership?

The marketing of farm products is a more complicated thing than the marketing of water or gas. In the marketing of water and gas, the plant management has to deal with two groups of humanity—its own employees and the consumers. In the marketing of farm products, there is a third group of human beings—the farmer—to be considered. Mr. Hoover says that the farmer is like a squirrel—you put your finger on him and he is gone. City consumers are likely to forget, that is, they put their fingers too hard on the dairy farmer; if they push the price too low, or arbitrarily put up the standards without increased pay, the farmer and his milk are no longer there. They have gone to the condensery or the creamery or to some other city. Or, if the condensery or creamery or other city are not prepared to take the milk, then the farmer sells the cattle and milk becomes scarce, and the consumer is forced to pay more—until, stimulated by higher prices, the farmer is again encouraged to raise more cattle. He may pay for his thoughtlessness for many years. The average consumer thinks no more about the farmers' costs of production and his alternative markets and the effect of these on his milk supply than the farmer himself thinks about the consumer. The farmer produces milk of any quality and sells it where he can get the most for it; the consumer expects his milk to descend upon him daily through the medium of a kind Providence which understands his need.

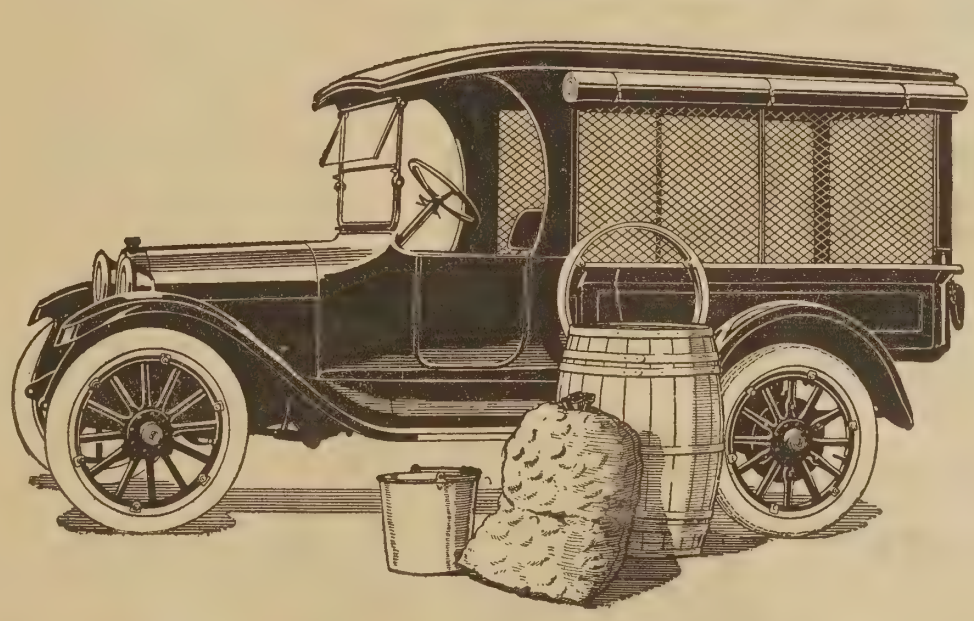
The thing we most need is education of consumer and producer upon the problems of each which affect both. We need a system which will force producer and consumer to sit together regularly and discuss these matters which vitally affect both. We need, for our municipally owned milk distributing system, a board of directors made up of representatives of the consumers, including men with business and financial experience, women, and representatives of labor; representatives of the labor and management of the milk plant itself; and representatives of the farmers from whom the city buys its milk.

Such a board of directors would be a real center of constructive criticism and of education. Here the farmer would have an opportunity to meet the consumer face to face, as he cannot do now, to inform him concerning his alternative market and his costs of production, and to warn him of the possible bad effects of any hasty action against the farmer. Here the consumer would have an opportunity to educate the farmer on the standards of milk desired and to encourage him to raise his standards by offering him inducements in the form of higher prices for the better milk. The consumer and the farmer would both have an opportunity to watch labor and management and to make suggestions for greater efficiency in the plant. Labor and management, on the other hand, would be given an opportunity to air their difficulties with both consumer and producer.

Fourth. The local municipal plant should be placed under the supervision of the State Division of Markets. The Division of Markets should give aid and advice in the purchase and equipment of the plant, the establishment of a proper accounting system, the regular inspection of the accounting and business practices of the plant, and the promotion of efficiency in its management.

The whole matter is an experiment. So at one time was every successful undertaking. Every thinking person knows there is something wrong with our milk marketing system. Not every person nor every city is ready or willing to try the experiment of righting it. No city or village should be forced to try it until its people are ready and willing. On the other hand, no city or village should be prevented from doing so. A law giving such permission will not hurt any city which does not want to take advantage of it. Its existence may greatly help those cities in which there are forward looking men and women who are not afraid to work for a cause so important to children and to future generations as a good milk supply and an efficient milk distributing system.

DODGE BROTHERS
BUSINESS CAR



Nearly all who use Dodge Brothers Business Cars on farms recognize three things in particular about them

It is known that they cost their owners little or nothing for repairs

It is universally conceded that the gasoline consumption is low, and tire mileage is high

They have an enviable reputation for unusually long life and faithful service

DODGE BROTHERS, DETROIT

PAT. 7-2-07
ANTI-COW-KICKER
Save your temper, your cows, your milk. Does not excite the cow, nor disturb the flow of milk. Indispensible for breaking heifers, cows with sore teats, or vicious kickers. Cannot wear out. Put on or off in 15 seconds. Guaranteed to be an absolutely perfect anti-kicker, or put on loosely as hobble for cow, horse or mule. Price $1.15 Postage extra. Weight 2 lbs. Send for it today, when you need it you won't have time.

Keep Down Costs Increase Profits

Higher yield per acre! That's the one thing to build to. Whether prices for crops go up or down, by producing more per acre—per man or per hour—you are certain of a profit.

Bigger crops at lower cost are a direct result of Samson Power Farming. You can plow deeper, till, plant, and harvest quicker and better, saving man power, time and money on all belt work as well, with a Samson Model "M" Tractor and power implements.

The experience of thousands of Samson farmers in all sections of the country has proved this. They made money last year and will make money this year. Will you take advantage of their experience to make certain the profits on your farm this year?

On the average farm today, power machinery is the solution of the farm production problem. It is coming sooner or later to every farm—the earlier the acceptance the quicker the profits.

Get the Facts Write Us Today

We have new information that will help you to put this year's production on a lower cost basis with larger profits for you. Sit down now and write a postal for it. It's yours without cost or obligation.

Judge Them by Results

NOT what they cost, but what they do and have done for others and will do for you—that is the basis on which to judge the value of Circle A Cork Brick.

Because a stall floor of Circle A Cork Brick is warm, resilient and sanitary, it affords protection against garget, rheumatism, hoof-rot and bunchy joints; it prevents slipping and minimizes accidents; saves bedding and requires little labor to keep it clean. Also, it wears almost indefinitely.

When their many benefits and long services are considered, the cost of Circle A Cork Brick is certainly reasonable.

What they do and why, and what they are worth to you is fully explained in the illustrated 28-page book, "Better Stall Floors," which you will receive promptly, and without charge if you will write for it.

Armstrong Cork & Insulation Company, 112 Twenty-fourth Street, PITTSBURGH, PA.

Association Notes

Tilleda, Wisconsin:—Frank Stefl's herd of Brown Swiss won first place in the association for 1920. The herd led the association by an average production of 20 pounds fat per cow, being 100 pounds of fat above the average. The high cow led all others by 80 pounds. There are 37 herds in the association.

Sullivan, Ohio:—Market milk testing 3.5% sold for $3.50 per cwt. and 5c per point above, in December. Feed prices were: Union grains, $3 per cwt.; chop, $1.67; bran, $2; oil meal, $47 per ton; cottonseed meal, $47; silage, $6; clover hay, $18.

Joe Daviess County No. 2, Illinois:—Two pure-bred bulls and two grade females were purchased and nine unprofitable cows sold during January. Market milk sold for $3.50 per cwt.; 3.6% test being required and 3c per point above paid. Feeds were bought at the following prices: Silage, 40c per cwt.; bran, $1.75; oil meal, $2.70; cottonseed meal, $2.50; corn, $1.50; oats, $1.65; barley, $1.65; molasses feed, $1.70; Cow Chow, $2.80; mixed hay, $1.25; wild hay, $1.20.

Racine and Kenosha, Wisconsin:—Four more herds were tested for tuberculosis during January. Four cows were sold for dairying and nine were sold to the butcher. Most of the members are feeding balanced rations. Two members have bought 14 pure-bred Holstein heifers whose dams have good A. R. O. records. Three per cent market milk sold for $2.85 per cwt. and 4c per point above. Feed prices are: Oil meal, $52 per ton; cottonseed meal, $48; gluten feed, $50; bran, $34; ground corn and cob, $34; ground barley, $39; ground oats, $37; Vitex, $54; Unicorn, $52; silage, $7; alfalfa, $28; clover, $24; corn fodder, $10; corn stover, $12.

Wood County No. 2, Wisconsin:—Due to the high feed prices in the fall, herds were thinned out. A carload of bran was purchased co-operatively and improvement of feeding has shown very creditable results. Cottonseed is very largely replacing oil meal for high protein concentrate and molasses is being fed with success. Two more pure-bred bulls, a Guernsey and a Holstein, have recently been purchased. In December the condensery paid 45c per lb. for fat, the creamery paid 48c per lb., and the cheese factory paid 54—61c. Milk retails for 10c per quart and butter for 50c per lb. Feed prices are: Shelled corn, $28 per ton; pure bran, $32.50; cottonseed meal, $50; oil meal, $50; oats, $32.

Rock Prairie, Wisconsin:—One car of bran was purchased during January. Five herds are doing official testing, and three herds have been tuberculin tested. Eight cows were sold to the butcher. January market milk sold for $2.50, and 4c per point above 3.5%. Milk retails for 14c per quart, butter for 50c per lb., and cheese for 35c per lb. Feed prices are: Bran, $35 per ton; oil meal, $50—$60; corn, $20; barley, $1.60 per cwt.; oats, $60c per bushel.

Wausau—Marathon, Wisconsin:—One registered Guernsey bull was purchased during January. Five cows were disposed of as unprofitable. The average profit for herds properly fed was $50.12, as compared with a loss of $0.03 for each herd improperly fed. A profit of $28.62 per herd was shown for those having watering cups, as compared with a profit of $24.20 per herd without drinking cups. Four per cent market milk sold for $2.20 per cwt. and 5½c per point above this test. The creamery paid 55c per lb. for fat and the cheese factory 50c per lb. Milk retails for 12—14c per quart, butter for 45c per lb., and cheese for 31c per lb. Feed prices are: Hay, $20 per ton; silage, $6; bran, $34; middlings, $34; hominy, $35; corn, $35; Wisconsin Balanced Ration, $50; International Dairy feed, $38; beet pulp, $36.90; oats, 48c per bushel.

Allenton—Kohnsville, Wisconsin:—Since the large drop in the milk prices, members are not feeding as much concentrates as before, but they are still feeding on a profitable basis as the records of this association are very creditable.

Roberts—Hammond, Wisconsin:—Practically all members are now feeding balanced rations. The end of the association year is near and many cows will be culled. One registered Holstein bull was purchased during January. Feed prices are: Ground oats, $27 per ton; bran, $32; barley, $31; International Dairy Feed, $31.

Amherst — Nelsonville, Wisconsin:—Ten cows and one bull were sold for beef and two cows for dairy purposes. Four cows were purchased by members. Good results are being secured by feeding balanced rations. The creamery paid 62c per lb. for fat during January. Bran sold for $34

per ton; oil meal, $50; Unicorn, $64; Tip Top dairy feed, $36.

McGregor, Iowa:—Several of the beef breeders are discouraged and are now breeding for milk production. One pure-bred Holstein bull took the place of a beef bull during January, and some former breeders of beef cattle are starting in with the milking strains. The dairy farmers are beginning to realize the benefit they can secure by feeding. In December the creamery paid 61c per lb. for fat. Milk retails for 12c per quart and butter for 54c per lb. Feed prices are: Oats, 37c per bushel; barley, 48c; corn, 60c; cottonseed meal, $35 per ton; mixed hay, $20; alfalfa, $25; timothy, $20.

Davenport, Iowa:—During January six cows were bought and six were sold, four of which were for dairy purposes and two for beef. There is at this time a surplus of milk, which is beginning to affect the price to some extent. Milk sells for 30c per gallon; butterfat, 45c per lb.; alfalfa hay, $25 per ton; cottonseed, $38; bran, $42; oats, 41c per bushel; corn, 50c.

Bourbon County Co-operative, Kansas:—Nearly all the members are using pure-bred bulls. Three cars of cottonseed meal have been purchased through the Farm Bureau and a fourth will be here soon. Owing to the low price of feed and the great amount being ground, dairymen are feeding heavily and the majority of cows are increasing in milk flow. Four per cent market milk in January sold for $2.90 per cwt. The condensery paid 57½c per lb. for fat; the creamery paid 43c. Milk retails for 12½c per quart; butter for 46c per lb., and cheese for 40c per lb. Feed prices are: Corn and cob meal, $17 per ton; ground oats, $30; bran, $32; cottonseed meal, $32; oil meal, $45; alfalfa, $15; silage, $7.

East Aurora Dairy Improvement, New York:—Work in this association was resumed January 1st after one month without a tester. The high cow this month, Roxy Jane Burke 2d, is a daughter of Roxy Jane Burke, a cow who recently entered her nineteenth year and who has produced six heifer calves in three years, eight and a half months, and is due to freshen in June.

Rutherford County, Tennessee:—One farm is selling a large number of grades to make room for more registered Jerseys.

Macoupin County, Illinois:—Twenty unprofitable cows have been sold during January and one pure-bred sire purchased. Many of the members are feeding balanced rations and are getting excellent results. January market milk testing 3.5% sold for $2.78 per cwt. and 5c per point above. Milk retails for 14c per quart and butter for 55c per lb. Feed prices are: Alfalfa, $30 per ton; clover hay, $25; oat hay, $18.60; silage, $7; corn, 80c per bushel; oats, 55c; bran, $1.75 per cwt.; hominy chop, $1.80; barley feed, $2.30; oil meal, $3—$3.50; Schumacher Feed, $2.10; molasses feed, $2.30; cottonseed meal, $2.10.

East Troy, Wisconsin:—Several Advanced Registry records were made in the association this month. Four cows were sold for dairy purposes and 12 unprofitable cows were disposed of. The average return for $1 expended for feed in January was $1.58; the average feed cost of one pound of butterfat was 44 cents, and the average feed cost of 100 pounds of milk was $1.64. The condensery paid 50c per lb. for fat in January, and in addition 10 cents per 100 lbs. milk. Milk retails for 12c per quart and butter for 58c per lb. Feed prices are: Bran, $34 per ton; brewers grains, $55; gluten, $47; Unicorn, $52; ground oats, $36; ground corn, $30; oil meal, $43; cottonseed meal, $48; mixed clover and alfalfa, $20; corn silage, $6; pea silage, $2.

Calkins, Pennsylvania:—Seven boarder cows were disposed of during January. Nearly all the members joined the farm bureau in the recent membership drive. Three per cent market milk in January sold for $3.25 per cwt. and 4c per point above. Feed prices are: Corn and clover silage, $6 per ton; hay, $20; gluten, $56; cottonseed meal, $45; wheat bran, $40; corn meal, $38; ground oats, $56; oil meal, $56; wheat middlings, $50.

Western Associations

Dawson H. Burwell of the Arkansas Valley Testing Association in Colorado reports that all but three members of the association are feeding grain this season. He states that the increase in production in the association has been 2,656 lbs. milk and 88.32 lbs. fat in three years. The 1917 average was 6,109 lbs. milk containing 216.48 lbs. fat. That in 1920 was 8,765 lbs. of milk containing 304.8 lbs. fat. At 50 cents per pound of fat, this increase equals $44.16 per cow per year.

In the Douglas County, Colorado, Testing Association twelve members are feeding grain, according to R. E. Sherman, tester. The total production in these herds because of this grain has been increased 1,086 lbs. of fat over the previous month. Thirty-six of the 40 leading cows of the association were among those fed grain.

In reporting the Wahkiakum, Washington, Association W. J. Carter, test-

TIMKENS MEAN - MORE and BETTER FARMING - BY POWER

A Book Of Interest To Farmers Everywhere

During a period of more than twenty years, 57,000,000 Timken Tapered Roller Bearings have been manufactured on an unchanged principle.

Because of their simplicity of design—

ease of installation—

compactness of mounting—

unparalleled performance—

uniformity of quality—

ability to carry radial loads, thrust loads, and all possible combination loads—

and their adjustability for the wear that *must* follow all motion, Timken Tapered Roller Bearings are playing an important and intensely interesting part in the development of More and Better Farming By Power.

While watching 57,000,000 Timken Tapered Roller Bearings at work we have learned much about the application of power to the farm. A descriptive analysis of this valuable information has been got out in a booklet, a copy of which should be in the hands of every farmer in America.

A postcard from you, addressed to Department H, will bring your copy.

When you write for the booklet it will be of great help if you will give the size of your farm and its present motor equipment.

The Timken Roller Bearing Co, Canton, Ohio

Timken Tapered Roller Bearings for Tractors, Farm Implements, Trucks, Passenger Cars, Machinery, Trailers, and Industrial Appliances

Send for free booklet on "More and Better Farming By Power"

TIMKEN Tapered ROLLER BEARINGS

FREE $20 BANJO Ukulele

Hawaiian Guitar, Violin, Mandolin, Guitar, Cornet, Tenor Banjo, Banjo, Ukulele

Wonderful new system of teaching note music by mail. To first pupils in each locality, we give a $20 superb Violin, Mandolin, Ukulele, Guitar, Hawaiin Guitar, Cornet, Tenor Banjo or Banjo absolutely free. Very small charge for lessons only. We guarantee success or no charge. Complete outfit free. Write now. No obligation.

EDITORIAL COMMENT

EXPERIMENTAL work is being carried on at the Wisconsin Station to determine what causes milk to coagulate in the process of condensing. It was thought that the milk produced toward the end of the cow's lactation period would coagulate more readily than that given by fresh cows. Extensive studies prove, however, that the period of lactation has no influence upon the readiness with which milk coagulates. The station has also secured data which show that the so-called alcohol test used by condenseries to test milk for acidity and to determine whether it shall be accepted is unreliable. It was proved that alcohol may or may not coagulate that milk which is readily affected by heating.

IN commenting on his gratitude to the Farm Bureau Federation for its services in securing a gift of a million bushels of corn for European relief, Herbert Hoover makes this statement which will be of particular interest to dairy farmers: "You will realize that in the special feeding of undernourished waifs and sick children we have to provide a very large proportion of condensed milk and other specially prepared foodstuffs. Our expenditures comprise approximately 50 per cent for dairy and meat products, 20 per cent for rice, beans, cocoa, sugar, about 20 per cent for corn, wheat, and other cereals, and about 10 per cent for clothing."

IT has been quite generally stated that one of the reasons for the rapid decline in the price of farm products may be attributed to the federal reserve banks which have not extended the credit to agriculture that they have in former years. This, we believe, is an inaccurate conception and not based upon the facts. There is need of a better system of financing the marketing of farm products, permitting the farmers to market their products in an orderly manner throughout the year and not forcing them to sell all their products at the time of harvest. But to say that the federal reserve banks were the cause of the rapid decline in the prices of farm products, we believe, is inaccurate.

According to the report of Governor Harding on the federal reserve banks, there was $720,266,000 worth of farm paper rediscounted in the year 1919, and in 1920, $1,980,000,000. In other words, there was twice as much farm paper discounted in 1920 as in 1919.

It is our opinion we can accomplish more for the building of our industry, for correcting its ills, if we know the truth. To use false basis for reasoning leads to false conclusions and this in the end leads to disaster.

RATIONS AFFECT VITAMINES IN MILK

At the Minnesota Experiment Station a study has been made to determine the influence which the cow's ration has upon the quality of her milk which makes it valuable in preventing such diseases as scurvy. In laboratory experiments it was observed that the milk from the University dairy herd during the late winter months was much less effective in preventing scurvy symptoms with laboratory animals than during the summer and early fall months. In order to obtain conclusive evidence concerning the influence of the cow's ration upon the vitamine content of the milk, dairy cows were fed vitamine-poor and vitamine-rich rations and the milk obtained was subjected to tests in the feeding of laboratory animals. At the University of Wisconsin where a herd of eighteen dairy cows were fed year after year on air dried roughage and grains, it had been previously found that the milk was inferior in its vitamine content to summer milk produced by other cows in the herd. In the Minnesota experiment the milk was secured from the same cows throughout the experiment eliminating, therefore, any question as to the differences of the milk from individual cows and making the test a very definite one of the value of various rations in their influence on the nutritive and vitamine properties of the milk.

Two cows, a Jersey and a Holstein, were given a vitamine-poor ration from the middle of January. Beginning June 1st they were fed a vitamine-rich ration. From the data obtained in the feeding of the several groups of guinea pigs with the milk from these two cows it was concluded that the vitamine content of milk is directly affected by the vitamines in the ration consumed. It was found that milk produced in the summer was three times as powerful in preventing scurvy as that produced under winter conditions. The tendency is for milk to decline very slowly in its vitamine values as the quality of the ration is cut down, while milk becomes higher in its vitamine value immediately upon the feeding of vitamine-rich rations.

NEUTRALIZER AND ADULTERATED BUTTER

The Attorney General of the United States has ruled that butter made from neutralized cream is adulterated butter and subject to a tax, as such, at the rate of ten cents per pound. This ruling of the Attorney General is far reaching in its effect and, if enforced, means the loss of millions of dollars to those dairy farmers who keep but few cows.

We have never approved of the marketing of decomposed or rancid cream, but we have favored the use of neutralizer so that sour cream could be pasteurized without heavy losses in the buttermilk and that a better quality of butter could be produced. Not only is the butter better in quality when sour cream is neutralized and pasteurized but it is a safer human food. To deny the creameries the privilege of neutralizing sour cream, or else require labeling the butter as adulterated and the payment of a tax of ten cents per pound and license fees, means that sour cream will not be pasteurized and that a poorer quality of butter—and less wholesome—will be placed upon the market.

Attorney General Palmer in rendering his opinion regarding butter made from neutralized cream said: "It cannot be considered butter as it is not made exclusively from milk or cream, or both, with or without common salt, with or without the additional coloring matter. . . . I conclude, therefore, that Congress intended to include such butter within the definition of 'adulterated butter' since it appears to be a purified or improved butter which is the result of processes during which substances have been introduced and used for the purpose of and with the effect of deodorizing and removing rancidity."

Congress had no such intention in mind. In 1902 when this law was passed, the practice of neutralizing cream was so little practiced, if at all, that it was not brought to the attention of Congress. It did not enter into the discussion when the law was framed defining adulterated butter. Further, the primary purpose of using neutralizer is not for deodorizing or removing rancidity—it is to neutralize the acidity. The adulterated butter law has to do with the finished product. It was enacted to prevent the addition of foreign substances to butter, like vegetable fat, glucose, earth, excessive quantity of water, etc. There was a time when cheap, foreign matter was mixed with butter to increase its weight or to cause it to hold more water. The adulterated butter law was passed to prevent such practices. That was the intention of Congress.

It should also be observed that the Act of May 9, 1902, reads: "'Adulterated butter' is hereby defined to mean a grade of butter produced by mixing, reworking, rechurning in milk or cream, refining, or in any way producing a uniform, purified, or improved product from different lots or parcels of melted butter or butterfat, in which any acid, alkali, chemical, or any substance whatever is introduced or used for the purpose or with the effect of deodorizing or removing therefrom rancidity." The law applies to *butter* rechurned in milk or cream, or reworked or mixed with chemicals or other substances and does not apply to the handling of cream. If Attorney General Palmer's reasoning is correct, then the addition of starter to cream might be considered an act of adulteration, for a negligible quantity of starter gets into the butter. It is our opinion that the Attorney General neglected to observe that the law applies to butter and butterfat melted, mixed with chemicals, and rechurned, and not to cream. Neutralizers are used to get the butterfat out of the cream in good condition and not to add weight to butter. Through its use butterfat undergoes no change. Elements and conditions with which it was associated, including the neutralizer used, are eliminated in the buttermilk and the butterfat goes on to fill the mission for which it was produced. Does Mr. Palmer object to this? Or does he want to crowd the dairy farmers to heavy loss through strained interpretation of the law, giving it a force which he ought to know is by no means its intent and purpose. The purpose of the law which Mr. Palmer is interpreting is to defeat fraud. Is there any fraud in treating a cream by a wholesome, sanitary process to bring forth a better product? A law is not interpreted correctly when it is given a meaning contrary to its own purpose.

We should have a law in each state which would provide a system of grading cream and forcing creameries to pay for cream according to its grade and a sufficient inspection force to prevent the sale of decomposed or rancid cream, as it is unfit for human food, no matter how the butter may be classified. Since sour cream is not necessarily decomposed or rancid, but can be a wholesome, healthful product, we do not comprehend how a law can prevent the manufacture of such cream into butter and the use of methods which will improve its quality and make it a safer food.

Butter made from neutralized cream is not adulterated, though it might be advisable, in deference to the right of the public, to know that it is made from neutralized cream.

A GOOD PLEDGE

Many creamery patrons in Wisconsin at their annual meetings this winter have passed resolutions pledging themselves not to use any so-called dairy substitutes and to use dairy products on their table. It seems strange that this required concerted action on the part of leaders—men who foresee the bad results if dairy farmers continue to use so-called dairy substitutes.

In surveys, made in several counties, it has been found that less milk is consumed in the country than in the cities. One county reported that only one child in six attending the rural schools consumed milk, and in this county dairying is the chief industry. Dairy farmers who buy substitutes are not only undermining their own industry but are denying their children a food which is vital to their growth, health, and development.

We believe it would be worth while for creamery and cheese factory patrons and farmers producing market milk to pledge that they will not consume so-called dairy substitutes and that they will provide an adequate supply of milk for their children to drink, all the butter they need, and a liberal amount of cheese. The dairy farmer should ever bear in mind that those manufacturing so-called dairy substitutes are ever at work to encourage a larger consumption of them, and it is only good business on the part of the producers of dairy products to not only contribute something for advertising dairy products but to show by their own acts that they believe in their products. The patron who uses so-called dairy substitutes cannot expect the consumer of the city to buy his dairy products.

Milking Machine and Inflamed Udders

I note that during the past year you have had a number of articles on the milking machine concerning its care, etc. We are milking our herd with a machine and find it one of the greatest labor saving devices on the farm. The cows like it and hold up in milk flow as well, if not better, than by hand. However, we have some trouble with inflamed quarters. By massaging the quarter, we can in a few days get it back to normal as far as we can tell but it takes lots of "elbow grease". Perhaps you could tell us how we can reduce this to a minimum or keep it out of the herd entirely.

Liberty, Idaho. F. M. B.

The experience of the above correspondent with milking machines is not at all unusual. There have been some who have blamed the milking machines directly for causing gargety and inflamed udders. This is a mistake. Milking machines themselves operate gently and do not directly cause inflammation in the udders.

Generally speaking, however, inflammation of a cow's udder is brought about by some injury in the first place. Maybe some cow standing near her in the stall has kicked her when lying down; maybe the cow has slipped on the cement floor; or maybe the cow has been forced to lie down on the cold frozen ground. There are many direct causes of garget or inflammation in the udder.

There will be inflamed udder trouble in almost any herd at times, whether a milking machine is used or not. I do not want to have it understood that inflamed udders are always caused by injury but in most cases injury is the primary cause. The regular gargety condition is a germ disease. It is, therefore, easily transferred from one cow to the other.

This is when the milking machine indirectly may be blamed. If no extra care is taken the milking machine will transfer this disease from one cow to the other easier than will hand milking. The teat cups are moist and the germs will be carried very readily from one cow to the other in the teat cups.

The remedy is to milk the exposed cows last. If the cow has an inflamed udder do not milk her first. Milk all of the healthy cows first and then the cow having the inflamed udder can be milked last and there is no danger of transmitting the disease from one animal to another.

If the cows having the inflamed udders have been milked first then be sure that the teat cups of the milking machine are entirely cleaned and sterilized before the remainder of the cows in the herd are milked by that same machine. Evidently the correspondent has had a case of garget in the herd and no attention was paid in respect to keeping it from spreading to the remainder of the cows.

If the swelling or the gargety condition is bad, I have found that pumping air with a milk fever outfit into the affected quarters is a good thing to do, and bathing externally with hot water to take down the swelling.

I would suggest milking the affected cows by hand. This to be sure that there is no abnormal milk being drawn by the milking machine. As soon as the cows become entirely normal then the milking machine can be used again safely. Then in the future avoid spreading of the disease as mentioned above.

Illinois. C. LARSEN.

Salt and Water for Cows

Please give me a ration for Holsteins that I can feed with the following feeds: corn and cob meal, ground oats, bran, cottonseed meal (36%), oil meal, beet pulp, gluten, corn silage, and alfalfa hay. How should cows be salted that are not turned out of the barn? When should they be watered? What would be the best feed for dry cows that we expect to test when fresh?

Dayton, Ohio. J. E. A.

These roughages furnish a splendid basis for a dairy ration. Our inquirer should feed as much alfalfa as will be cleaned up and supply silage at the rate of 35 or 40 pounds per day. In addition a concentrate mixture of 400 pounds of corn and cob meal, 200 pounds of bran or ground oats, 100 pounds of cottonseed meal or oil meal, and 100 pounds of gluten will give good results if supplied at the rate of one pound for each four pounds of milk produced.

Beet pulp is best when soaked several hours in three or four times its weight of water and fed so that cows receive the equivalent of three or four pounds of the dried pulp daily.

In calculating the economy of a ration it is necessary to compare the prices of these different feeds. If beet pulp is much more costly than corn silage, do not feed it, since silage furnishes a valuable succulence. Choose between bran and ground oats on the basis of their cost.

We favor placing salt where cows can have as much or as little as they please, rather than including it in the grain mixture. If it is impossible to allow free access to salt, see that they receive about an ounce or ounce and one-quarter per day. There is some advantage also in having water before cows at all time. The watering cups sold on the market have been proved to be profitable investments. If cows receive water which is warmed enough that it will be taken in liberal amounts, they will do very well if given a chance to drink twice a day, in the morning after feeding and late in the afternoon.

Many farmers follow the practice of feeding dry cows roughage only. It is our observation that it pays to be rather liberal with grain in order that cows may freshen in good condition and be vigorous and healthy. A mixture of 200 pounds of oats, 200 pounds of bran, and 100 pounds of oil meal may be fed rather liberally to cows close to freshening.

Cows which are several weeks away from parturition may have corn included in their ration fairly liberally, but better results are secured when corn is not fed in too large amounts to dry cows.

Corn Experiments

HOARD'S DAIRYMAN:—In the winter and spring most of us farmers get to thinking about our seed corn. We wonder how it can be improved in any ordinary way and whether we are working along the right track in choosing the ears for the spring seed. Our Ohio Experiment Station has made several comparisons that seem to me most interesting and profitable for every one of us farmers.

I have often wondered about the real facts as to a better ear of corn being rough or smooth kerneled. Many older farmers have told me that if one chose ears that were all smooth the yields would run down in a few years. I like to husk and handle the smooth kernels, as would any farmer, but I have been keeping to the rougher types because I thought these men were experienced and knew what they talked about. Yet after twelve years of careful comparison the yield has been found to be nearly 2 bushels greater from the smooth ears than from the rough ones. I would have saved a good many rough fingers and disagreeable husking days had I known this sooner and also would have a slight increase in yield for the time.

A study of the relative yields of ears of a tapering shape with those of cylindrical shape shows a difference of nearly two bushels an acre in favor of the tapering shapes.

Tips that are filled out completely with kernels is another thing we have been taught much about. I have discarded hundreds of ears of seed corn that suited me pretty well but were not well filled at the tip. I thought I was doing the best thing. In thirteen years the difference in yield is very slight.

Adaptability of seed corn is another point raised and considered. The station fears that seed corn shows and advertising by the seed growers tempt us farmers to go too far away from our local climate for seed. Seven different samples or lots of almost the same variety show that seed from Kansas, Illinois, southern Ohio, and from the O. A. E. Station tassel out from July 24 to Aug. 8. The percentage of moisture varies from 17.8% to 33.7%; the last of course from the Kansas seed. Seed from almost any reasonable distance can be selected and acclimated so that it is a safe seed to plant but to invest wholly in a new kind brought from a long distance and especially from a warmer climate is risky. As a general thing it is unsafe to move a variety of corn into a region of average shorter growing season.

Comparisons of yields of plantings in the hill of from 1 to 5 kernels show that 4 kernels make the best showing on an average for 15 years. One kernel averaged 32.36 bushels of shelled corn to acre, 2 kernels produced 51.37, 3 kernels produced 62.24 bushels, 4 kernels made 65.63 bushels, and 5 kernels made 64.03 bushels. The difference between 4 and 5 kernels is not great. Not so great as I imagined. And here I have learned something as I always have kept to the 3-kernel a hill planting. I didn't lose much but better than 3 bushels to an acre is something too.

Our experiment stations are doing a helpful work and the bulletins that they issue are not studied enough. We farmers can try out a certain type of corn for a year and think we know something about it. Yet it is those 4- and 5-year records that average up and show the real value of certain characteristics of an ear. These are the results that are valuable to us.

I keep a rack of bulletins near my desk and I supposed that I had carefully read all of them. Yet during the last 3 weeks while confined to the house with sickness I have studied many of them over again and have discovered points that I overlooked at first reading. It may easily be that at the end of this season this forced vacation from farm work will show that I am farther ahead than as if I hadn't taken this time to study my farm and its condition a little closer.

Ohio. EARL ROGERS.

Inbreeding

In case you had a few 15-month-old heifers to breed and a 3-year-old bull who is their sire and a yearling bull of the same sire, the former a pure-bred and the later a grade, which one would be your preference to use?

Lykens, Pa. J. M. B.

If the 15-month-old heifers are strong and robust and especially if they are grades we would have no hesitancy in recommending that they be bred to their own sire, particularly if he is a good individual and has a pedigree which it is expected will improve the production of the herd.

When a grade sire is used little progress can be made in the development of the dairy herd. Of course it depends upon the blood of the grade and it is possible to find grades that are superior to pure-breds. A grade animal is likely to carry much inferior blood and is quite as likely to transmit this to his offspring as he is to transmit the good blood.

It is not uncommon for breeders of pure-bred cattle to inbreed, especially if they desire to establish certain characteristics and types and to concentrate the blood of an animal which is an exceptionally good individual and capable of producing animals of unusual dairy merit. The inbreeding, however, of pure-breds requires considerable skill or failure is likely to follow. The breeder must have a good understanding of the weaknesses of his animals and what he is striving for if he is to make a success of this method of breeding.

There is comparatively little danger of producing poor results in breeding a sire to his own daughters if they are grades. In fact, it has been recommended that this is the best course to pursue for the improvement of the dairy herd.

Rotted Manure

HOARD'S DAIRYMAN:—Rotted manure is apt to be a substance of rather uncertain composition so far as fertility elements are concerned. Theoretically, rotted manure should be more valuable pound for pound for plant uses than fresh manure for the reason that the plant food which it contains is more available for assimilation. In other words, it holds a larger percentage of fertility elements than waste which is newly produced. Both of these statements, however, are apt to be misleading in that neither of them takes any account of the losses involved in the rotting of the manure in question. The gain, so far as fertility elements is concerned, is apt to be more apparent than real.

The conditions prevailing during the rotting process have much to do with the real value of the resulting product. If the decomposition has gone on in the open where the waste has been freely exposed both to sun and rain no man can say—short of actual analysis—how much plant food remains after leaching and bacterial fermentation have demanded their toll. It may be little enough! If, on the other hand, the manure has been stored in a pit of tight construction and has remained there long enough for disintegration to take place, the loss will be limited in all probability to the escape of a portion of the nitrogen in the form of ammonia due to bacterial action of heating. However, manure rarely stays in a pit long enough to undergo decomposition to the same extent that it does in a neglected pile.

The physical results which accrue from rotting are likely to be more uniform than are those that are purely chemical. The manure becomes of similar character throughout. The coarse litter is disintegrated and a more intimate mixing with the soil is possible when the waste is applied. Furthermore, there is less actual material handled because in the process of rotting, manure naturally loses weight. However, the best place for manure to rot is under ground. In this case nothing can be lost.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Canadian Holstein Makes Creditable Record

The two-year-old Holstein heifer, Dora Mutual Posch, owned by B. Sommerfield & Son of Canada, has recently completed a very creditable seven-day production of 382 lbs. of milk which contained 14.78 lbs. of fat. At this time, this heifer is on yearly test and promises to complete an equally good long-time record. She holds the fourth highest official short-time record in her class in the provinces of Manitoba, Saskatchewan, and Alberta.

Dairy Day at Logan, Utah

HOARD'S DAIRYMAN:—Dairy history was made in Cache County, and, in fact, in the whole state of Utah, when about 200 farmers gathered at the Utah Agricultural College for a day of instruction and the first auction sale of dairy cattle held in the state. A banquet in the evening was largely attended.

President E. G. Peterson of the college welcomed the visitors. J. E. Dorman, head of the Western Dairy Division, talked on co-operative bull associations and the improvement a pure-bred bull makes, even on the first generation of daughters, in milk and butter production. Mr. Dorman used actual illustrations to bring his subject home to the dairymen. He was followed by Mr. Castle, in charge of cow testing in the Western Dairy Division. Mr. Castle brought his subject home to his audience as shown by the fact that some forty farmers stood when they were asked how many would be interested in the forming of a testing association in Cache County.

Ben R. Eldridge, state dairy agent, talked on the feed cost of milk production. Illustrated lantern slides were shown of different families of both pure-bred Holsteins and Jerseys, the prominent breeds of the state. The big event of the day followed when the crowd adjourned to the stock judging pavilion for the auction.

Eight Holstein bull calves and two Jersey calves were sold. Before the sale Robert Wrigley announced the fact that there are in Cache County at the present time 82 scrub sires being used. Cache probably leads the counties of the intermountain country in dairying in spite of this.

The sale was topped by the 12-month-old calf, Bornholm Elko Ormsby, bred by the Bornholm Dairy Farm of Utah. He went to S. Bankhead for $132.50. Four of the other seven sold to Utah dairymen for more than $100 each.

At the banquet A. F. Cardon was toastmaster. O. D. Merrill responded to the toast "Why we Produce Milk". "Financial Outlook" was the toast given by H. E. Hatch. He promised support from the banks for the purchase of pure-bred live stock. Lorenzo Hansen of Borden Condensed Milk Company thought the dairy outlook was good. F. S. Harris said that the good farmer on the economical farm unit has no fear as to the future.

The program was under the direction of Professor Geo. B. Caine of the College and Robt. Wrigley, county agricultural agent.

Utah. LE ROY FUNK.

S. W. J. C. B. A. Elects

The annual business meeting of the Southwest Jersey Breeders' Association held at Springfield, Missouri, January 29th, is reported by Secretary F. W. Atkeson. J. E. Jones of Missouri was re-elected president, O. B. Reitz of Kansas was elected vice-president, and Mr. Atkeson re-elected secretary-treasurer. With the newly elected directors, the directorship is now as follows: E. L. M. Benfer, Professor J. B. Fitch, and R. A. Gilliland, Kansas; H. C. Young, Nebraska; Geo. Ziegelhoeffer, E. G. Knight, S. H. Redman, C. M. Walbridge, F. P. Durnell, B. C. Settle, E. G. Bennett, R. W. Barr, J. W. Head, M. L. Golladay, Rolla Oliver, Professor A. C. Ragsdale, Earl Thomas, C. J. Tucker, F. J. Bannister, and R. E. La Force, all of Missouri.

Mr. Atkeson says: "Never in the history of the association has it had a directorship so well chosen both as to ability and to geographical representation of the territory. With such a body of men back of the organization great results ought to be accomplished during the coming year. In the election of the new president, precedent was discarded as he will be the first man to ever serve a second term as the head of this association. The breeders chose wisely and it is well they picked a man like Jones, as this year's stewardship will require a man with ability. A good man will continue to build on the firm foundation builded by the good director before him."

Denver Butterfat Contest

At the National Western Stock Show at Denver, January 17—21, a butterfat contest was conducted in which thirteen cows were entered, including ten Holsteins, two Guernseys, and one Shorthorn. Prizes totalling $280 were given for the highest production for the several ages. Making allowance for the differences in ages, the Guernsey breed had the peculiar distinction of having one of its two representatives at the top and one at the bottom. The Shorthorn won eleventh place, leaving the other ten winnings for Holsteins. J. W. Purvis of Colorado owns the winning Guernsey, which won with a production of 245 pounds of milk containing 11.243 pounds of fat in the four-day test. N. R. D'Arcy, also of Colorado, won second place with a Holstein which produced 326.6 pounds of milk containing 10.683 pounds of fat.

Dairying Thirty Years Ago

Taken From Our Issue of February 27, 1891

To determine whether "the boy should leave the farm," the farm should have a vote in the matter, as well as the boy.

⚜

New Hampshire has 111,335 cows and 39 creameries which turned out 2,250,000 pounds of butter for the year ending September 30, 1890, and which netted the patrons about $500,000.

⚜

The three Elgin milk condensing factories are working under the following contract for six months commencing October 1st: For October and November they paid 2¾ cents per quart; for December and January 3½ cents; for February and March they pay 3 cents.

⚜

Mr. O. N. Dennison of Wisconsin, says: "The requisites to get good milk for the manufacture of creamery butter are honesty, cleanliness, and confidence. Farmers must deal honestly with the cows and with the creamerymen and the creamerymen must deal honestly with their patrons and customers. There must be cleanliness in the barn, with the milk utensils, and in the factory. Mutual confidence must exist between the producer of the milk, the butter maker, and the proprietor of the factory. If any of those points are lacking in any particular, there is a loss in the best results to be obtained from the dairy."

Some are consciously dishonest and some are dishonest and don't know it. Somebody is cheated in either case. Honesty is always the "best policy" in dairying.

⚜

There are many men who are as unfit to associate with a good dairy cow as they are to own her. They are either too ignorant, or too stupid, or too stingy, or too mean to treat a herd of such cows decently, and according to the life and purpose of such cows. Putting a finely bred grade cow even into their hands will result about the same as putting a diamond ring in a hog's nose.

HENRY C. TAYLOR

Henry C. Taylor, chief of the Office of Farm Management for the United States Department of Agriculture, is well trained for his work. Not only has he taken degrees from the Iowa Agricultural College and the University of Wisconsin, but he had eight years of work in the "college of hard knocks" in running his own farm. He learned the problems of farm management and in a way which has given him a practical view of farming and makes his farm management work turn out workable, practical facts rather than the theoretical. In running his farm, he did not manage it from a shady porch but "with his sleeves rolled up and his back bent and the stuff by which we earn our daily bread streaming down his brow". He ran his farm and taught the theories and practices of farm management in the University of Wisconsin until 1919. At that time the United States Department of Agriculture needed a chief for its Office of Farm Management. Mr. Taylor was selected. His practical farm experience enables him to settle upon worthwhile problems in farm surveys and the investigational work carried on by representatives of his office. Every item of farm business is handled in a systematic way and brought into proper relationship with the other items which go to make up successful management. Mr. Taylor has furnished a simple account system which can be applied on any busy farm. It is made to fit many types of farms, but can be adapted so that it is workable under any practical conditions. The purpose of his work may well be expressed as follows: "I believe the worthiest task under the hands of the Farm Management Office is that of helping the farmer to better living; to save the muscles of that tired back by finding a better way to do the farm work; and to devise means whereby the farm family may enjoy the comforts and the recreations which are the rightful privileges of the profession that forms the sturdy base of our social pyramid."

Montana Guernsey Association Prospers

The Bitter Root Guernsey Breeders' Association held its annual election at its regular monthly business meeting in January. The reports of the officers showed a most successful year, an increase in membership, increase in pure-bred sires used, and an increase in number of pure-bred females in the association. The treasurer reported that the association realized over two thousand dollars net from the co-operative pure-bred sale held last June. It is planned to use this fund for educational purposes to inform the people, especially of Montana, of the benefits of dairying and the fitness of the Guernsey cow for Montana dairying. With a $15,000 shipment of pure-breds last year into the valley, the association will soon be in a position to furnish foundation stock well acclimated for Montana needs.

The following officers were elected for the next year: L. M. Erhart, president; Dennis Sullivan, vice-president; Mark D. Fitzgerald, secretary; and B. B. Liddell, treasurer.

Montana. MARK D. FITZGERALD.

Missouri Starts War on Scrub Bulls

$1,000 Prize Offered to the County Farm Bureau Making Greatest Progress

Forty-four county farm bureaus in Missouri have started a united war on scrub bulls. The Extension Service of the Missouri College of Agriculture is centering its efforts on the better bull campaign as one of the foremost projects for 1921. The various breed associations, both county and state, are co-operating in the drive against the scrub. County agents, the State Board of Agriculture, and the Chamber of Commerce of Kansas City, co-operating with the College of Agriculture, forecast the early doom of many scrub bulls in Missouri.

Two thousand dollars in four cash prizes of $1,000 first prize, $500 second prize, $300 third prize, and $200 fourth prize, is offered by the Chamber of Commerce of Kansas City to the county farm bureaus whose counties replace the greatest number of scrub bulls with registered animals during the year 1921. The Greene County Farm Bureau is offering $100 to the school district that will replace the greatest number of scrubs. Other counties are planning to prorate any prize money they win among the men who have purchased pure-bred bulls. Bankers in Southwest Missouri are working out a plan whereby $300,000 will be furnished by the banks of that section as a revolving fund to be used in purchasing dairy cattle. This will stimulate greatly the use of registered bulls.

Rules of the contest specify that, "A scrub bull has been replaced when he is castrated or sold out of the county and an interest purchased in a registered animal." This ruling should stimulate considerable interest in bull clubs since several scrubs may be replaced by one pure-bred bull. Twenty counties were required to enter the contest before prize money was available and at least 25 scrub bulls must be replaced before a county is eligible to a prize. The execution of the rules of the contest is entirely in the hands of the "better bull committee" composed of men on the faculty of the College of Agriculture.

Missouri. GEO. W. CATTS.

Notes from Kansas

HOARD'S DAIRYMAN:—Butterfat in Kansas City sells for 40c and 36c local. Cows are not high. A cow that sold 18 months ago for $150 would bring $50 or possibly $60 now. Feeds are scaling down. Alfalfa that was held at $22 in November is going on the cars for city sale at a prospect of $17 to $18 and a net to shipper of $14 or $15; corn 50c, oats, 33c; and wheat, $1.65 and hogs 9c. Wages are dropping from $60 and $70 a month to $40 and $50. "General H. C. L." seems defeated, but it seems that always "General Poverty" must march his armies through before the allied commanders "Prosperity" and "Work" can make triumphal entry.

The failure of a couple of million dollar firms brought temporary local stringencies to the banks here. Money already was tight. But it made the banks do some house cleaning on worthless and trash paper. The failures made a tighter though safer business condition for all eastern Kansas. Silver money still is in hiding, and only the safest of banks are allowed to look at a $5 gold piece. Business is still blanketed with its paper overcoat.

Kansas. S. M. SIMMONS.

Feed Markets Experience Less Selling Pressure

[Report by U. S. Bureau of Markets.]

Early in the week ending February 12 the feed market was greatly depressed and unsettled. Occasionally the offerings were heavy and, with buyers exceedingly scarce, prices worked lower. The latter part of the week, however, there was a decided change in the undertone, particularly in the Northwest. Less selling pressure was in evidence and the market steadied. This change in sentiment did not materially affect the country demand, the trade remaining conservative about taking hold and only exhausted stocks appearing to force new purchases.

Large quantities of bran were sold in the Minneapolis market at $19. The wheat feed market at the close was a trifle firmer owing to the better demand for early spring shipment. Middlings were quoted at about the same price as bran in many of the markets. Canadian offerings continued to be made in New England territory at 50c to $1 below western prices.

Cottonseed meal in transit was in fair demand. The southeastern trade is developing very slowly and farmers are delaying purchases for the planting season. Quotations in shipping sections are fairly steady though slightly lower than last week. Hulls are unchanged and in light demand. Jobbers in the Chicago and other important markets are making offerings at lower prices than those quoted by mills.

The demand for linseed meal, both foreign and domestic, improved and prices stiffened slightly particularly in the Northeast. Chicago jobbers reported increased inquiry from eastern sources, the export demand in that section having absorbed surplus offerings, with the result that brokers discontinued, quoting lower prices than mills. Cincinnati quotations indicate a decline of $1.50 from last week because of ample supplies and light demand.

The demand for hominy was good particularly from the Northeast, during the last 3 or 4 days and prices remained only steady in spite of higher cash corn quotations. Yellow and white hominy were quoted on the same basis in many markets.

Hay Prices Slump

Reports from the various markets for the week ending February 12 indicate a widespread depression in the hay market. The price level of both timothy and alfalfa have been lowered about $1 per ton during the week, the average price of No. 1 timothy at the principal markets now being about $26 per ton and that of No. 1 alfalfa being about $25 per ton. Further declines seem likely unless there is a marked improvement in demand or shipments are reduced.

Rate reductions to points in addition to those mentioned in previous reports have been granted by several western railroads as follows:

Northern Pacific rates to Minneapolis—St. Paul—From Livingston and points east thereof, 42½c; from Missoula and points east to Livingston, 46½c; from Montana points west of Missoula, 50c.

Great Northern rates to Minneapolis—St. Paul—From Billings and points east thereof, 42½c; from Helena, Butte to and including Kalispell, 46½c; from points west of Kalispell, 50c.

Burlington rates to Omaha and Council Bluffs—From Billings and points east thereof, 42½c.

Burlington rates to Kansas City and lower Missouri River points—From Billings and points east thereof, 46½c.

From western Colorado points rates have also been reduced from $15.50 per ton to $12 per ton, and from Wyoming points from $11.20 to $9.60 per ton.

Considerable western alfalfa is being handled by Chicago dealers, being shipped to Omaha and rebilled direct to Chicago rate points. This hay is being sold at about $26 per ton which nets the Idaho shipper about $10 per ton.

Some price reductions have occurred during the week on straw in a few of the markets. Wheat straw is quoted as follows: Baltimore $14, Pittsburg $14.50, Cincinnati $10, Chicago $12, Minneapolis $8. Oat straw—Kansas City $9.75, Omaha $8.50, Minneapolis $8.50, Chicago $13, Pittsburgh $14.50. Rye straw—New York $18, Pittsburgh $15, Cincinnati $16, Chicago $14.

Thirty-Fifth 1,000-lb. Holstein

The Holstein cow, Anna Lenox De Kol 2nd, owned by Harry Yates of New York State, has recently completed a year's test in which she produced 29,162.7 lbs. milk containing 1,073.3 lbs. fat. She is the thirty-fifth cow of this breed to produce 1,000 lbs. of fat or more in a year.

Other quotations: Grain hay sold for $21 in Los Angeles; peanut meal (30%) sold for $37 and velvet bean meal at $27.50 in Jacksonville.

A. F. B. F. in New Headquarters

On March 1st the American Farm Bureau Federation moves into its new headquarters at 58 East Washington Street, Chicago. The new offices are at the corner of Wabash and Washington Streets, one block north of the old quarters. A space of 3,300 square feet on the 11th floor of the Garland Building will be occupied. This compares with a small office room occupied May 1st, last, by President J. R. Howard and Secretary J. W. Coverdale and indicates the very rapid growth which the organization has made.

Two Years' Creamery Figures

The report of the Holmen Creamery Association of Wisconsin at the annual meeting of its stockholders Feb. 14 gives an opportunity for informing comparisons in the business of a co-operative creamery in the two years 1919 and 1920. The average net price paid to patrons for butterfat in 1920 was 67.79 cents, while the price in the previous year was 66.6 cents. The cost for gathering 100 lbs. of butterfat last year was $1.536 and for gathering 100 lbs. of cream, 37.8 cents. The cost in 1919 was $1.40 for gathering 100 lbs. of fat and 34.21 cents for gathering 100 lbs. of cream. The average price received for butter in 1920 was 58.74 cents, which compares with 57.37 cents in 1919. Slightly more cream was furnished in 1919 than during the last year, the two figures being 2,220,943.2 lbs. and 2,120,455.4 lbs. There was a corresponding decrease in the amount of fat received, the total number of pounds in 1920 being 540,403 as compared with 521,590 lbs. The total disbursement for the two years differs very little, being $550 more in 1919, the 1920 total being $384,272.03.

Mr. J. N. Nelson is secretary of the Holmen Creamery and Mr. V. S. Keppel president during the past year.

Dane County Holstein Breeders

The Holstein breeders of Dane County, Wisconsin, met at Madison February 10th and formed a county association for the breed. M. F. Peck was elected temporary president and K. L. Hatch, secretary. J. E. Stolen, L. J. Hall, R. H. Shuster, M. F. Peck, Louis Gray, and Otto Topfer were appointed to the board of directors and form a committee for increasing the association's membership. The permanent organization will be effected at a meeting to be held at Madison March 4th.

Railroad unions have offered to haul farmers' gift-corn free of charge for labor. They have declared their willingness to furnish engine and train crews to handle the gift-grain in solid train lots. A telegram by which the formal offer was made is as follows: "With regard to the press announcements that western farmers are ready and willing to donate free of cost, fifty million bushels of corn to feed the starving millions in Europe and China, we believe that arrangements can be made with the railroad presidents to furnish cars to transport this corn and deliver the necessary amount needed to the coast cities free of charge. The organizations we represent will furnish engine and train crews to handle this grain in solid trainload lots free of charge for service rendered. We will be glad to co-operate with you in any arrangements you may desire to make."

A fireplace is a splendid ventilator and a good social center.

Lowe Brothers

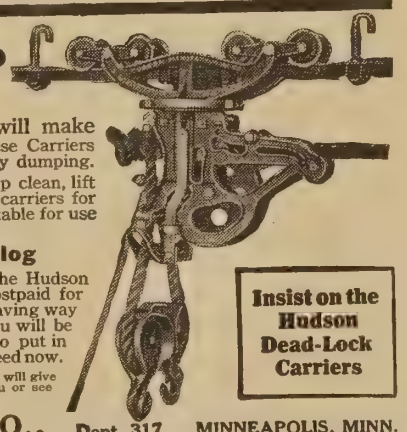
If you bought Paint like you do Overalls you would save money.

If you could only hold a can of paint up to the light and see any thin places in it, like you can a pair of overalls, you could tell at a glance whether it would wear.

Most paints, no matter how carefully you put them on, will always stay in a series of fine ridges. Between every one of those ridges are the *thin places*. It doesn't take the weather long to wear through them. Then away goes the rest of the paint.

That's one of the reasons why some paints don't last.

You can't hold paint up to the light but you can buy a make of paint that has a reputation that will stand looking at that way.



Next time you are in town, drop in and have a chat with the man who sells Lowe Brothers.' Or right now send 10 cents for our Happy Happening Book. Or better yet—do both.

The Lowe Brothers Company

HUDSON Haying Tools
(Formerly Strickler)

Make a Quick, Clean Job of Every Load

A Hudson Carrier in your barn this season will make quick, easy work of putting away your hay. These Carriers are simple, extra strong, positive in action and easy dumping. Used with either slings or forks they pick the load up clean, lift it quickly and easily. We make carriers for steel, cable or wood tracks, adaptable for use with any style fork or sling.

Ask for FREE Catalog

Get ready for haying now. The Hudson Catalog will be sent free and postpaid for the asking. Shows the labor saving way best suited to your barns. You will be surprised how little it costs to put in the Hudson equipment you need now.

Write for free Catalog today and we will give you the name of our dealer near you or see that you are supplied.

117 HUDSON MFG. CO., Dept. 317 MINNEAPOLIS, MINN.

SEED

By Prepaid Express—Order NOW—Prices Going Up.

Our first quality, hardy northern-grown grass seed, famous for its frost and drought resisting qualities. High and strong in germination. Our price about two-thirds below last year, but now tending upward. Order EARLY. We pay all express or freight charges; bags free. Specials: Alsike and Timothy mixed $5.85 per bu.; Alfalfa $12.90 bu.; Medium Red Clover $13.50 bu.; Alsike $16 bu.; Timothy $3.95 bu.; Sweet Clover $4.50 bu.; Sudan Grass 8½c per lb. As seedsmen of many years experience we have carefully graded and tested these seeds. We guarantee them to be as represented, or your money back. You must be satisfied. We are not connected or associated with any other house selling direct to farmers. Order TODAY or send name for price list and full particulars. World Seed Company, 123 W. Madison St., Dept. P, Chicago, Ill.

GOOD SEEDS

Grown From Select Stock—None Better—50 years selling seeds. Prices below all others. Buy and test. If not O. K. return and I will refund. Extra packets sent free in all orders I fill. Send address for Big Catalogue illustrated with over 700 pictures of vegetables and flowers of every variety.

Should We Consider Soy Beans

(Continued from page 219)

North Carolina, where they have been using soy beans for hay for many years, says, "We find that we can cut grain feeds nearly half when we feed soy bean hay, and not use as much hay as we do of any ordinary hay." Mr. Clapp states further: "I do not know the value of the stalks after threshing, but find that cattle will eat nearly all of them."

As a Regular Hay Crop

Farmers living on those soils where clover and alfalfa are extremely uncertain and where trial after trial of these legumes brings only failure, are realizing the great importance of this soy bean as a hay plant. The bean straw is very appetizing and will be cleaned up fairly good, but in no way gives results like the real leafy hay. Very few farmers as yet have sowed beans just for the hay crop, but it is on the light and swampy bed types of soils where soy bean hay could be made to be the deciding element in a successful dairy. I can hear some good farmer chuckle to himself when he reads this, thinking how impractical it is to recommend soys on swampy soils. They grow good, he reasons, but that blamed frost always strikes the low land first. And true it is that on some certain low areas in the state it would be unwise to plant very many of these soys for a hay crop. Some years all low areas escape long enough to make a good soy bean hay crop, but in all cases a farmer has to use his knowledge gained by past experience as to whether or not frost will do any damage to his certain pieces of low lands.

Where the yield is extremely light, not yielding more than one-half a ton per acre, the cost of machinery and labor would be more than the value of the crop. This one-half a ton would be the very minimum in a poor year but is too low to be considered a paying crop. On good soil our soy beans for hay yielded in 1920 from 2,700 pounds to 5,300 pounds per acre, depending upon the variety. Is there really any excuse for a farmer to feed good respectable dairy cows on timothy or wild hay?

As a Silage Crop

At the Rhode Island Experiment Station it was shown that very little is to be gained by planting soy beans in corn. A greater tonnage could be obtained from a given piece by planting corn and soy beans separately. There are many farmers who would never have any soy beans in their silos if they had to plant them separately and mix them at time of filling the silo. Therefore, the easiest method is used, that of planting together. It takes no more planting, the same cultivation will do, and soy beans look a great deal better than weeds, which it seems creep into many of our fields. Then the corn binder will get the beans at the same time as the corn so it's an easy way of harvesting where practical. Just how much the corn crop is hindered in any way from developing normally because of the beans in them is not easy to determine and will vary with the thickness of corn, and the height of stalk. If the mixture could be one part soy beans to four parts corn and the acre would yield ten tons, the increased protein would be about 100 pounds or as much as could be gotten by buying at least 600 pounds of bran. But the mixture seldom is as rich as one to four, although it is planted this way, and probably would be one to six or seven, in which event the protein content might not be more than 3% more than corn silage, instead of the 5% where it is a one to four mixture. Farmers using soy bean and corn silage, however, all report fine results.

In those sections of the country where soils are heavy with poor under drainage and likely to be slow and cold, maybe the best results can be obtained from planting soy beans separately and then mixing at time of filling the silo. A tonnage of from four to ten tons of green forage can be expected on this type of soil in an ordinary year, depending upon the variety and weather conditions. It is more trouble to mix at time of silo filling than to have it mixed with the corn, but by having the beans separate the amount of beans can be more easily regulated in the mixture.

On light soils where clover and alfalfa are very uncertain, a fine stack of soy bean hay will help reduce feed bills and make those cows respond as nothing else would. This stack belongs to D. K. Barrett, Burnett County, Wisconsin. See how fine he has the choice hay protected by swamp hay.

One farmer last year told me that he got eleven good loads off from half an acre of green beans that had been planted for silage, but this is the unusual and not the average.

Soy Beans in Hogging or Lambing Off

In the corn belt thousands of acres are used for hogging off purposes. In some counties in this state considerable hog raising is done and the practice of having soys in with the corn tends to make a balanced ration for hogs. Either sheep or hogs learn to like these soys and, once they get started, it takes more than a poor fence to keep them away. One man last year had soys in with corn for silage purposes. The variety he planted was too early, ripened up before corn was ready for ensiling. When he did cut it he found that only a few beans went in with the corn and that the ground was covered. After plowing a strip in this field, he happened to think of his hogs and that they might like these beans. The hogs were turned loose and not only all the soys on top of the ground disappeared but the pigs rooted all his newly plowed ground over in search of more soys. While in Indiana this past fall I observed many farmers lambing off their soy beans and corn. These sheep could destroy but little of the good corn, only that part that was blown down, but were eating soy bean leaves, soy bean seed, weed seeds, leaves of the corn, and seemed to be thriving beyond reason.

Farmers in the United States are now confronted with heart sickening problems—selling farm produce at fire sale rates and buying equipment on nearly a war basis. Conditions won't be this way long, but more than ever a farmer must be efficient. Make the cost of production less. If soy bean hay will lessen the cost of the

feed bill plant soy beans. If soy beans will help your soil so that you can raise something else that will make your feed bill less, plant soy beans. If soy beans in with your corn is profitable as a hogging off proposition, or a lambing off deal, or a cattle filler after silo filling time, or as a silage proposition, plant soy beans. Never admit defeat until you have tried your best. Just plant soy beans.

Norton Reports Michigan Holstein Activities

In his annual report of the activities of the Michigan Holstein Breeders' Association, Secretary H. W. Norton, Jr., accepts the opportunity to give some very wholesome advice to the members of this association. Among the several activities of the association during the past year he lists the summer meetings of the local associations and the farm tours which have been made in different parts of the state. He suggests that in many cases these tours are too long, which makes the stops too brief. He makes the observation that many of the breeders visited were almost entirely unable to discuss the breeding and the records of their herds. He suggests that the ability of a breeder to demonstrate the merits of his herd is one of his greatest assets and recommends that every breeder give this matter close attention. Tours were conducted in twelve counties and summer meetings attended in fifteen. Two county association herds were exhibited at the state fair last fall. Mr. Norton pointed out that the plan of exhibiting county herds furnishes the best opportunity for bringing together a show herd with which to represent Michigan at the National Dairy Show.

Michigan, Mr. Norton stated, stands fifth among the states in the number of its pure-bred Holsteins, having a total of about 24,602. He emphasized the fact that this number, in the total cow population of Michigan of 900,000, gives the breed a very large opportunity within the state. Emphasizing the part Holstein breeders have had in promoting the accredited herd plan he showed that more than two-thirds of the herds under state and federal supervision in the state are Holsteins, there being 425 herds under supervision at the beginning of 1921. Of these, 137 are fully accredited and as many more had passed one clean test. Of the 18,038 head of cattle under supervision in Michigan, only two and one-half per cent reacted.

Six public sales were handled by the state association, in which 337 animals sold for an average of $403.65. Mr. Norton says that in these sales an effort was made to keep the offerings up to a high standard and to get the best of guarantees and that in consignment sales especially it is of utmost importance that only first class individuals be offered. At dispersion sales, says Mr. Norton, this cannot be so well controlled, but the methods employed and the guarantees given should be the best. It is planned to hold two state sales each year, one in May and one in October. In the sales handled by the association all registry and transfer papers are turned over to the buyers immediately after the sale. The statement is made that not over three per cent of the dairy cows in Michigan are pure-breds, that the number of grade and scrub sires is great, and that a campaign will be conducted to increase the number of pure-bred sires. A "Holstein sire train" will be run through some of the newer sections of the state.

"A girl sixteen years old does my milking. The cows are milking as well as by hand. One fresh cow bellows for it as if it were her calf." —HARRY J. GAMBLE.

Please Your Cows With a Perfection

DID you ever hear of a cow bellowing for a milking machine as if it were her calf? Owners frequently tell us that their cows actually bellow for the Perfection just as they do for their calves.

But is it any wonder? The Perfection's way of milking is so much like the calf's that it is called the perfect copy of the calf. The gentle suction followed by a downward squeeze, followed by a period of rest exactly duplicates the calf's milking.

You can please your cows with a Perfection. They will prefer to be milked by the Perfection rather than by hand. Your boy or girl can milk with the Perfection as well as you can.

At the same time you are pleasing your cows you are pleasing yourself. Perfection returns its cost in less than a year in wages saved. It saves you time and drudgery. Your cows will like it. Contented cows mean more milk. Most owners find their cows give more milk when milked with Perfection. Why wait any longer? Get a Perfection.

Write for Booklet

Write for the booklet, "What the Dairyman Wants to Know." It tells in detail why Perfection milking means contented cows. We'll also send the names and addresses of the Perfection owners near you.

Why Milk by Hand? Cows prefer the Perfection.

PERFECTION MILKER

Wisconsin's Get-Together Conference

WISCONSIN farmers respect and use their state university and agricultural college. Another demonstration of this took place at the "Get-together Market Conference" at Madison during the first ten days in February. Hundreds, if not thousands, of farmers attended the meetings and took part in them. They were hungry for information and the smaller conferences were quite as enjoyable as the larger public meetings where speakers of national reputation filled the main auditorium.

⚜

President J. R. Howard spoke to an unusually appreciative audience and applause frequently accompanied his sallies of wit and humor. "Business will never flourish," said Mr. Howard, "until the buying power of the farmer is restored. When that power is restored we are not going to hear any more complaints about factories running part time and labor being out of employment. * * Labor is our best customer. When it is well employed at useful things and at good wages, we always have a market. The crest of unemployment is working from East to the West, and it will probably soon pass over.

"The other day I looked at a lady's dress in a store window, and it was marked down to a reduced price,—but they need not have told me that this dress was reduced. It was apparent. I would like to see a steer in a show window, marked '8½ cents, reduced from 16 cents'; or a hog, '9 cents, reduced for 23 cents'; or a bushel of corn, '41 cents, reduced from $1.75'."

The following quotation epitomizes in a way Mr. Howard's simple philosophy and why men have confidence in him: "I am hopeful of the future. I live in the United States, not in Russia. Sanity is going to rule in this country, not chaos. Farm population is diminishing. So much the better for those that are left. The more people we have to feed, the more demand there is going to be for our product, and the better price we are going to get for it. It is a good time to stick to the farm. When the first couple was let out of the Garden of Eden, they did not go to town, did they?"

⚜

In the opening conference, Dean Russell discussed Wisconsin's good fortune in having a diversified farming and the better credit facilities available to the dairy farmer. Wisconsin must produce higher quality products, and then see that they are properly graded and standardized for market. The individual farmer cannot do this, it will take a well organized co-operative sales agency. He advocated proper storage facilities in order that crops might be gradually marketed instead of being dumped on the market for speculators to play with. He endorsed in particular the Wisconsin Cheese Producers' Federation, and advocated the policy of uniting on a commodity basis rather than as a community selling various products.

⚜

In his discussion of the world's wheat market, Dr. Alonzo Taylor pointed out that declining wheat prices have not materially benefited the consumer. The chief supply of wheat for European countries must come from North and South America. In the United States the mills are reducing their "shelf goods", and he looks for a resumption of buying and better prices within, possibly, the next six months. He analyzed the buying power of the world and asserted that short time credits to Europe would be of very little assistance in rebuilding these countries so that they may become self supporting. Her old markets are largely gone, and she cannot get these back. She must find new outlets for her goods. The United States, he said, must arrange to extend long time credit to Europe if our raw materials are again to flow freely to these countries.

⚜

Mr. Lever opened his address on agricultural credit with the statement: "In these critical times, there is no place for the pessimist. This great country of ours is not headed for the demnition bow-wows. The one big immediate need is the restoration of confidence in the future of our country, coupled with a resolution that we are going to think and act in the light of the sun and not in the gloom of darkness."

"The existing credit system," said Mr. Lever, "has been built up to meet the especial needs of commerce. The 60 to 90 day paper is of little use to the farmer, he needs a credit of 12 to 15 months. This can be accomplished by pooling the assets and the issuance against such pooled assets of certificates of indebtedness of varying periods of maturity. The country should be provided, first of all, with adequate warehousing and elevator facilities. The warehousable products of the farm should be warehoused and against them issued warehouse receipts by commodities. These warehouse receipts should be pooled in the hands of a government trustee, regionally, and against these should be issued certificates of indebtedness with varied maturing dates, these certificates to be offered for sale on the money markets of the country. It may be necessary, in order to give these certificates prestige, to have back of them as an initial capital a revolving fund of sufficient money appropriated out of the treasury. From the sale of such certificates the farmer would derive the money with which to make country life worth while. The working of this system of farm credits, as well as the solution of other problems of agriculture, depends upon organization of the farmers themselves under sane, conservative, and fundamentally sound leadership. Without this all these efforts will fail. With it there can be but success."

⚜

Secretary Meredith was well received and his discussion of the activities of the Department of Agriculture gave to many men a better conception of its great value. His discussion was largely in the nature of "selling" the department to the public, and this is the particular task the secretary set himself when he took over the Department a year ago. More than half the funds appropriated to the department are not used for agriculture, but are for the meat and food inspection in the interest of consumers. He specially emphasized the relatively low salaries allowed department employees and investigators.

⚜

At the cheese marketing conference the Wisconsin Cheese Producers' Federation and the federation of the producers of foreign cheese were the main subjects of discussion. It was held essential that there should be established official grades and standards if the producer was to get the largest benefit. In addition there should be proper warehousing facilities in order that cheese might be properly ripened and also that an undue surplus would not be thrown on the market during months of high production. To accomplish this, organization and proper financing are necessary. The two associations mentioned above were recommended for this purpose and farmers generally urged to support and expand them.

PULLING STUMPS BY MACHINERY IN MARINETTE COUNTY, WISCONSIN

⚜

The committee on butter marketing found that the same quality of butter did not secure the same price. This was largely due to the fact that the seller had not studied market quotations so as to take advantage of the best market. Other factors were loss in weight and varying commission charges. In view of the fact that the managers of many creameries do not have the training necessary for marketing butter at the highest prices and for other reasons, the committee recommended:

1. That a general meeting be called of all parties interested in the welfare of a number of creameries in a given territory. At this meeting there should be given a report of the prices received for butter and paid for supplies at each of these creameries. There should be discussion of the consolidation of cream routes, the importance of pasteurization, the savings possible from carlot shipments, and the employment of a field man.

2. That each shipment of butter be graded and stamped by an official inspector, licenses for which will be issued by the state under proper regulations.

⚜

The chairman of the milk market conference committee first presented his own views, in which he emphasized the possibility of a constructive program in which every phase of the industry had a part. He held that the producer was in an illogical position when he sought to market his milk as an individual and that it should be the policy of the state to strengthen the inclination of the producer to work collectively and help overcome the lassitude and inertia brought on by the labor and worry of the average farmer's daily life. It was his opinion that the farmer should have an alternative market for his product and should assume certain responsibilities for these markets. He described his ideal of the marketing unit to be something similar to that so well started in Vermont and also that we might well learn from the Portland plan as recently described in Hoard's Dairyman. He also discussed in a broad way the problems of the distributor, the manufacturer, and the consumer.

The following committee's report was read and adopted by those attending the conference:

"The slogan of this 10-day conference is "Get together" and on that slogan has this committee based its conclusions.

"The production and marketing of milk is a complicated industry which for practical business purposes is subdivided into communities in each of which dairy farmers center about one or more processors or other outlets as a creamery, cheese factory, condensery, or shipping station. This is the starting point for any improvement in production or marketing along constructive lines which require either lower costs, improved quality, or better prices. For the farmers to reduce their costs or to produce higher quality goods in commercial quantities which will command a better price on the market and bring to them through processors or milk distributors a greater income requires mutual understanding and confidence between both parties. Such relations are built up only by organization. Be it therefore recommended:

"1. That milk producers normally furnishing the same local or community markets be organized to obtain facts concerning milk production, improvement of quality, conditions of manufacturing or distributing and such other economic understanding as will impress both parties with their mutual problems and responsibilities.

"2. That each local milk producers' association maintain a relations committee to meet with a similar committee appointed by the agency to whom milk is sold, for the purpose of providing at all times a sympathetic point of contact and a direct means of approaching and considering each other's problems.

"3. That each local producers' association maintain a standing committee to study the relative merits of the various existing or prospective market outlets for milk, and to foster the establishment of co-operative enterprises for the manufacture of dairy products whenever and wherever conditions warrant or demand such action.

"4. That the local producers' association and the agency to whom milk is sold mutually assume the responsibility of organizing an annual conference at which the following subject shall be thoroughly discussed:

A. Lower cost of manufacturing and distributing milk and its products.

B. Lower cost of producing whole milk.

C. Cow test associations.

D. Improvement in the quality of raw milk and its finished products.

E. Fundamental principles of economics as applied to production and to marketing.

Copyright 1921, by The Goodyear Tire & Rubber Co.

When Mud Locks Road and Lane—Haul on Pneumatics

"At least 20% of our trucks' work is on-the-farm hauling, in the sand-clay loam of the orchards. All of our highway travel is over clay and sand roads that turn thick and slippery in wet weather. So you can see that ours is not a question of pneumatic tires or some other type; for only the cords can master all these conditions. No other kind can haul in and out of the orchards. As for road work under favorable conditions, the Goodyear Cord Tires make three trips to two on any other; they effect a 25% saving of fuel, and an equal economy in depreciation, and with one truck and two men they haul as much as five teams and five men can handle. The utmost of the ability, economy, and long life built into these capable tires is assured by the Goodyear Conservation Service."—S. O. Monk, Superintendent, The Felton Farms, Marshallville and Macon, Ga.

SUCH intensely practical advantages of the big pneumatics as those described above reveal the special ability of Goodyear Cord Tires to cope with year-round farm conditions.

Their wide, tractive surfaces and buoyant bodies ride surely and powerfully in thaw-loosened fields and over roads hub-deep with the mud of Spring and Fall. They keep up a swift gait that means extra loads hauled. They resiliently cushion both the truck and the cargo.

Detailed reports of farmers' experiences with motorization and pneumatics are furnished on request to The Goodyear Tire & Rubber Company, Akron, Ohio, or Los Angeles, California.

Clover in Oregon and in Washington

HOARD'S DAIRYMAN:—The keynote crop for rotation systems in Western Oregon and Western Washington is red clover. The western districts of these two states is indicated specifically because the Cascade Mountains divide both states into districts as different as are the states of Vermont and Idaho. East of the mountains, semi-arid climatic conditions prevail and there alfalfa and sweet clover are the most profitable legumes, but in the western part of Oregon and Washington, a cool moist climate prevails and red clover is a fundamental unit in rotation systems and the most valuable soil improver of any leguminous crop. It grows on practically all types of soil there, but does best on well drained loams which have a good supply of organic matter. Different methods of securing a stand are followed in those districts.

Clover is usually grown with a nurse crop which protects the young plants and affords some return while it is getting a start. The methods of securing a stand are as follows:

1. Clover may be sown with winter grain in the fall. It may be sown with wheat, oats, barley, or rye. The latter crop is least desirable, however, because of its rank growth. An advantage of fall sowing is that it allows reseeding in the spring if the fall sowing is a failure for any reason.

2. Clover may be sown along with winter grain early in the spring before the grain has made any spring growth. This seeding should be made from the middle to the latter part of February in most years, and cannot usually be delayed after March first, as the grain is usually growing by that time. Seed should be covered with a harrow or weeder if the ground is dry enough. If not sufficiently dry for harrowing, it is usually the case that freezing and thawing and spring rains will cover the seed properly.

3. Clover may be sown with spring grains. When sown with oats, a light sowing of the grain should be made. With spring grain, clover should be sown in March or April. The best nurse crop for spring sowing is beardless spring barley which matures early and does not make an especially rank growth. Oats and common barley make a very rank growth and mature late in the season using much moisture and plant food and may cause a weak stand of clover.

4. Clover may be sown with rape in the latter part of April or early May. On farms where summer pasture is needed, it may be broadcasted and harrowed in, but the better plan is to drill it. Ten to twelve pounds of clover should be sown with three to five pounds of rape. After six or eight weeks the rape is pastured with sheep or hogs, and unless the field is pastured too closely, the stock will not disturb the clover. Trampling the soil by the animals compacts it and brings moisture to the clover roots. Pasturing should not be done when the land is wet.

5. Clover may be sown alone in May on a well prepared soil.

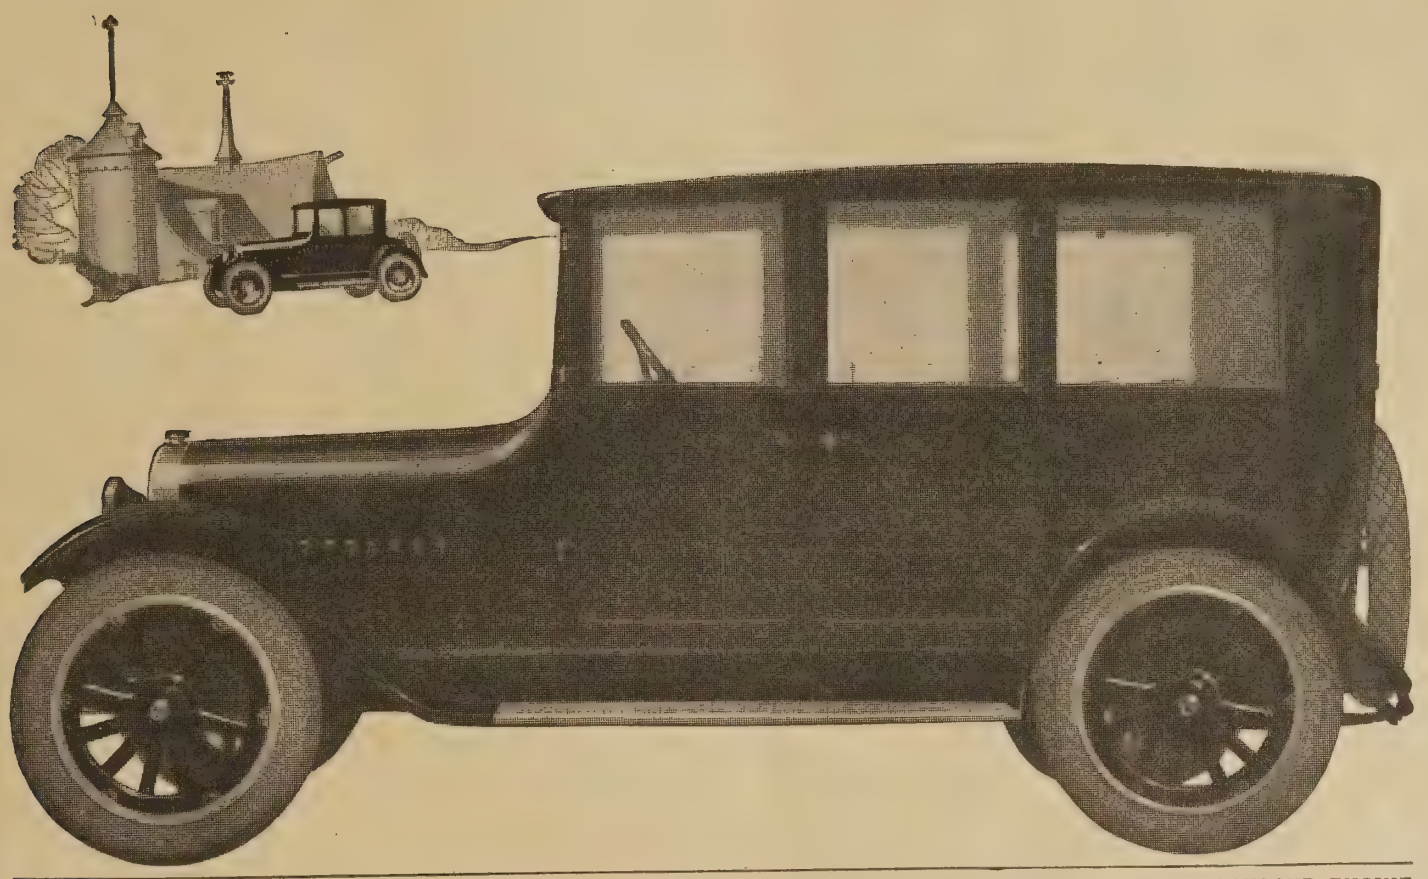
6. Another method of seeding clover is to sow on grain stubble in the fall covering late. This method is fairly successful on grain uplands, but is an unsatisfactory method on a low moist soil, as the clover may freeze out.

The best methods are sowing with winter cereals with beardless spring barley, with rape, or alone in May. Careful preparation of the seed bed is important for the success of the two latter plans. Under such conditions, plowing should be done early to save moisture. Frequent harrowing is essential and before seeding it will usually pay to run over the land with a float. Clover in Western Oregon and Western Washington is used for hay, soiling, pasture, seed production, and to plow under as a soil improver. When grown for seed it is often pastured until the middle of May. Sometimes it is clipped in May and the clippings fed or put in the silo. The second crop is then used for the seed crop. The second crop makes a more upright growth, ripens more uniformly, and produces more flowers. Harvesting also will come in the dry season and there is less injury to the late crop by injurious insects, among which is the clover midge. Straw from red clover seed production is worth approximately $10 a ton for fertilizer and the seed crop of three to five bushels has returned $60 to $100 per acre during the past year or two.

Oregon. F. L. BALLARD.

In three months Minnesota has added 40,000 members to its Farm Bureau Federation. The total membership the first of this month was 54,000, which is an increase from 14,000 as the result of a ninety-day campaign. President L. E. Potter reports that township units are now being organized at the rate of twenty per day.

The extra growth pruned out of the orchard this winter won't be in the way of effective spraying later.



ROSAIRE'S CHIMES, A JERSEY OWNED BY DEL PERKINS OF OREGON WHOSE RECORD IS 13,644 LBS. MILK, 828 LBS. FAT IN ONE YEAR

Silver Chimes of S. B. is the sire of this new record maker. He is the sire of 13 R. of M. daughters including Silver Chimes Gwendola, former yearling champion of the breed with a production of 644 lbs. fat. Her dam, Rosaire's Rua Queen, has a record of 8,136.1 lbs. milk, 455 lbs. fat.

Oakland

OAKLAND OWNERS REPORT RETURNS OF FROM 18 TO 25 MILES PER GALLON OF GASOLINE AND FROM 8,000 TO 12,000 MILES ON TIRES

THIS OAKLAND SENSIBLE SIX SEDAN IS POWERED WITH THE FAMOUS 44-HORSEPOWER, OVERHEAD-VALVE OAKLAND ENGINE

Summer or winter, over country or city roads, every mile in an Oakland Sensible Six Sedan is a comfortable mile. And an economical mile, also. For this efficient car delivers its reliable service at the very minimum of cost. Consider carefully these things about the Oakland, then contrast against them the very moderate price at which this Oakland is sold. Certainly no earlier type of motor car offers equal value, whether as an investment or as a means of satisfactory personal transportation.

OPEN CAR, $1395; ROADSTER, $1395; FOUR DOOR SEDAN, $2065; COUPE, $2065

Wisconsin's Get-Together Conference

(Continued from page 232)

"5. That to further the organization of these local associations and to enable them to be helpful to each other by interchange of information, experience, and by comparison, a Wisconsin federation of local milk producers' associations be established and vigorously promoted.

"6. That the members of all branches of the dairy industry shall support the Wisconsin Dairy Council in its campaign of education and advertising. In the end this will result in a better understanding by consumers in both city and country that milk and other dairy products are absolutely necessary in the daily diet if we are to continue as a nation of strong, healthy, vigorous men, women, and children. Not only this, but also that they may realize that these products are the best foods, are relatively cheap in price, and are delightfully palatable.

"7. That there should be established a state committee on milk marketing that will be properly representative of the producers, consumers, manufacturers, and distributors of the various dairy products, as well as social welfare workers, the agricultural and city press, and such technical investigators and state or city departments as are directly concerned with the products in question. Such committee should meet at least once each year and whenever it is felt that its deliberations will benefit the industry."

The pea growers and canners held a spirited meeting, the committee reporting as follows:

"To promote co-operative relations between canning factory managements and pea growers and to provide arrangements by which unavoidable misunderstanding and difficulties confronting either canners, farmers or both, in each locality, be it recommended that the Wisconsin Canning Crop Growers' Association be perfected to carry out the preceding purposes according to the following resolutions:

"1. That a relations committee of three growers representing the growers, and a similar committee of three persons representing the canner be established in each community where peas are grown and canned.

"2. That the pea growers of each community and the canner mutually assume the responsibility of organizing an annual conference at which the whole problem of growing peas, canning them, and marketing the same, be fully covered so that all parties will understand more fully each other's problems and responsibilities.

"3. That because pea canners differ greatly in operating efficiency and are located in separate sections where customary arrangements are vital to the quality of finished products, and because unsettled market conditions make a prediction of future prices uncertain, for the present let all matters relating to price and method of buying be left for adjustment between the growers and canner of each locality."

Butler Sells to Meridale

What is probably the largest Jersey transaction ever made is that in which Edmund Butler has sold his importing and auction sale business to Ayer & McKinney. Mr. Butler sells every animal he owns in this country and upon the Island of Jersey. These cattle will go to Meridale Farms, owned by Ayer & McKinney, and the annual auction sale business established by Mr. Butler will be conducted there. Mr. Butler plans to purchase a farm on the Island of Jersey and breed animals of the Sybil's Gamboge family.

Mr. Butler started his importing business seven years ago. Until 1917 his importations were sold at private sale. His first public sale, May 2, 1917, brought an average of $550.80 for 92 head. In 1918 he sold 60 head which averaged $1,001.91, establishing a new world record for averages. In 1919 his August 4 sale set an average of $3,367.02. Forty-seven head were sold and set a world record for auction sales for all breeds of dairy cattle. In 1920 he sold 60 head for an average of $3,110.83.

Cheese Prices Steady With Tone of Trading Improved

(Report by U. S. Bureau of Markets.)

With an increased demand from the distributing trade, cheese markets took on a more confident tone during the week ending Feb. 12, and the general condition of the markets at the close showed considerable improvement over the past few weeks. Trading, however, remains somewhat irregular, as dealers are not unanimous regarding the outlook for the immediate future, and some are still dubious as to what the next few weeks may bring in the nature of price changes. Just at present cheese prices are holding steady.

Receipts of fresh cheese at distributing markets are beginning to show a slight increase, and while there are still some defects, the general quality is good for this season of the year. With an improvement in quality there is better demand for goods of this class and as trade shifts to this or to lower cost fall make, the demand for higher cost fancy held cheese slackens. As a result, prices of fancy are in some markets a trifle weaker in a wholesale way. However, there is very little wholesale business on account of light supplies, and the market on held cheese is generally satisfactory. Some of the stocks remaining in storage consist of cheese which will probably have to be moved into export channels when exchange rates become more favorable. Export business continues to be fairly quiet.

The average wholesale prices on American cheese (style Twins) for the week ending Feb. 12, 1921, and for the corresponding week last year, were as follows:

	Week ending Feb. 12	
	1921	1920
	Cents	Cents
New York	27.7	30.8
Chicago	24.6	28.8
Boston	24.7	32.0
San Francisco	23.6	28.10
Wisconsin	24.4	28.7

The total receipts of American cheese at these markets were 2,523,873 lbs. as compared with 2,612,968 lbs. a year ago and 3,305,039 lbs. for last week.

Sharp Recovery Follows Declines in Butter Market

(Report by U. S. Bureau of Markets.)

The weak, demoralized market conditions which have marked butter trading for some time past carried over into the week ending Feb. 12. There was, however, a general firming up toward the middle of the week which was followed later by a sharp recovery and which makes it appear that the slump has hit bottom. Conditions up until this time were worse, if anything, than they had been the previous week and the market almost reached the panic stage.

Danish Butter Hard to Move

Little, if any, Danish butter arrived during the week. Present holdings could only be sold at a loss so little was cleared. A few fair sized lots were moved at 41c to 42½c. The steamer United States is the only cargo of Danish now reported to be on the way, but an authentic statement as to her cargo is still unavailable. Early estimates were 22,000 casks but later reports are that the load will be between 8,000 to 10,000 casks. Some new offerings were made this week for future delivery at 38c to 40c c. i. f., while other bids of 39c were refused. England is said to be in the market only for finest butter at 37c, undergrades not being wanted.

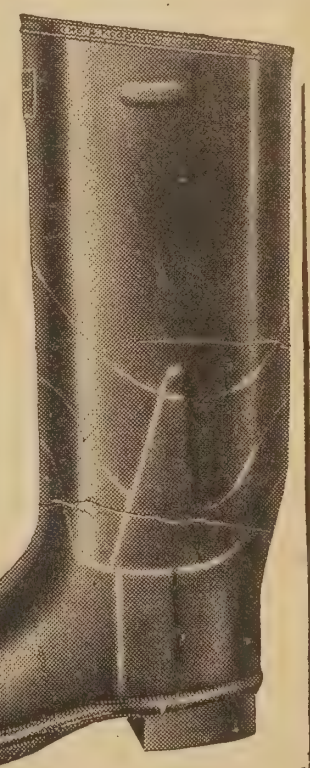
Fresh butter, it now appears, will continue in fair demand for the present. Storage prints in boxes sold as low as 25c and an entire car of tallowy butter sold for 18c. Both of these sales were on the Chicago market. Storage 90-score centralized sold down to 35½c for February delivery on the Chicago clearing house call but recovered later to 37c.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending Feb. 12, 1921, and corresponding week last year, were as follows:

	Week ending Feb. 12	
	1921	1920
	Cents	Cents
New York	43.4	66.1
Chicago	43.7	58.9
Philadelphia	43.9	67.1
Boston	43.8	65.5
San Francisco	40.3	60.6

The receipts of butter at these markets were 6,901,382 as compared with 7,807,566 lbs. last year and 7,701,510 last week.

With the RED LINE 'round the top



More farmers and dairymen are wearing Goodrich Rubber Footwear today then ever before.

The reason for this tremendous increase in users is simple—Goodrich wears longer than other footwear, and farmers have found it out. Naturally, when a man buys a pair of Goodrich "Hi-Press" and they last so much longer and are so much more comfortable, and so materially cut down that big footwear bill—he's going to tell his friends.

More and more farmers are finding out that Goodrich won't leak, peel or come apart—it can't, for it is made in One Solid Piece—that's the Goodrich way.

Look for the Red Line 'round the Top when you buy. 60,000 dealers are now selling Goodrich.

Dairy Show Goes to Twin Cities

The National Dairy Show of 1921 goes to Minnesota. The dates are October 8th to 15th, inclusive.

A delegation of business men representing St. Paul and Minneapolis interests came to Chicago to convey an invitation to the Executive Committee of the National Dairy Association to hold the 1921 Show on the State Fair grounds of Minnesota. The heartiness of the invitation delivered by the men of the Twin Cities, coming, as they said, with the endorsement of the whole Northwest, and the enthusiastic picture of dairy progress in the Northwest, left no alternative to the committee other than to accept the invitation.

So it is now everybody together for a big dairy inspiration meeting for 1921 in this wonderful dairy country.

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

The Mystery Workers

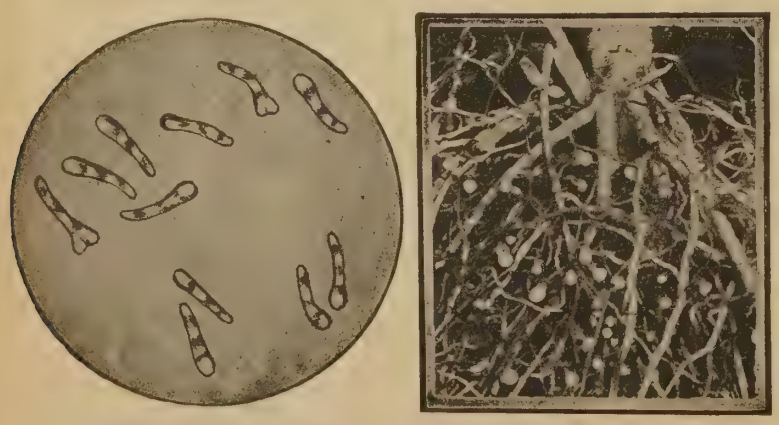
Milk sours. Apples and potatoes decay after a time. Cider sours and finally turns to vinegar. Corn that is packed into the silo ferments and manure stacked in a pile will rot. These are all very familiar processes which surround our every day life. But as common as they are, they are not understood by many people even though they have been familiar to mankind ever since the beginning of things.

And all these and many similar ones have only been understood since the perfection of the compound microscope, because with it the mystery workers that have always brought about these changes were discovered. Their discovery takes us back to the year 1675 when a Dutch scientist made it known to the world that these changes were being performed by a group of one-celled organisms which he was unable to classify as animals or plants, so simple were they in their structure. Today we speak of these little workers as bacteria and it is through them that many of the baffling problems of science have been understood. Many people have died on account of the ravages that some of these little mischief makers produce when once they gain a foothold upon our bodies. And today science treats successfully the deadly diseases which they produce and from which thousands have lost their lives in the past. But all bacteria are not harmful and when once we understand the place of them in the world, we can easily understand that we could not get along without them. They are just as necessary as are the plants and animals upon which we depend day after day for our living.

To those who have made a study of these little organisms, there are three principal forms or types of them. One kind is shaped like a ball and they usually cling together in clusters. It must be remembered that all are so tiny that they cannot be seen without the use of a microscope that magnifies them many times. The second group is shaped like a pencil or we commonly say they are rod shaped. They cling together in chains, end to end. One kind shaped like these is the cause of the deadly anthrax, a disease common to cattle. The third type is cork screw shape; that is, they are twisted threads. All exist in countless numbers and we now know that the air, the food, and the water we drink are filled with them. Sometimes people speak of them as bugs. This is entirely wrong as a bug is something quite different.

If animal and plant life did not decay upon dying, such elements as carbon, nitrogen, and sulphur would soon become lost to the living things of the earth. All dead matter would simply accumulate and the time would arrive when new plants could not grow for lack of the proper things to live upon. The soil is filled with countless numbers of these tiny workers, and like the bee they are always at it. The life of one bacterium is comparatively short. It simply divides into halves and makes two new ones. This is going on all of the time so it is little wonder that there are so many of them.

All plants that make their own foods must have carbon, and we know that they take it in through their leaves from a gas in the air known as carbon dioxide. This gas is given off every time we breathe, every time that coal and wood are burned, and every time plant and animal tissues decay. It is always the result of burning of some kind. And so we see that the decay of all the plant refuse that is turned back to the soil helps to keep up the supply of this gas from which growing plants get their carbon. If it weren't for this, all of the carbon would soon become tied up so that it could not be used.



THE ABSENCE OF THE MYSTERY WORKERS MAKES THE DIFFERENCE

The formation of this gas by the work of bacteria is absolutely necessary. The nitrogen which the plants stored away in their tissues is likewise returned to be used again when the plants and animals decay. How important this all is could only be realized if the process which sets free these elements could be stopped for a time.

It is quite a matter of every day knowledge that one of the most important things which a plant must have to make a good growth is nitrogen. But plants cannot use the nitrogen contained in the manure and other organic matter of the soil. It must be worked over into other forms just as much of our food must be prepared in a certain way before we can use it as such. The final product produced by the bacteria that bring about the changes is called nitrate. In this form plants can use the nitrogen because it is soluble in water and it is carried into the plants in this way. What, then, would our crops be like if these tiny fairies were not on the job to combine the nitrogen in this way? As interesting as this all is, there is something still more wonderful which these tiny little busy bodies are capable of doing under the right conditions, providing we have the ones which fit the case.

If the farmers had to depend upon adding stable manure to the soil to keep up a nitrogen supply for the plants, the soils would soon become very deficient in this element, because no matter how carefully the manure is cared for there will always be some loss. It is quite safe to say that not more than 75% of all the nitrogen contained in the food eaten by the animals is ever returned to the soil. If this is true, and it is as has been found out scientifically, how could we successfully provide the nitrogen in the soil which all plants must have? You will agree, I am sure, that the problem would be a very difficult one to solve. But fortunately nature has seen to all this, and all we have to do is to carry on a close co-operation with Nature and the workers she has provided to do the job. Nitrogen, the most expensive of all the elements, can really be had but for the asking. Provide the proper conditions and it will come and the soil will grow rich in a nitrogen content.

THE MYSTERY WORKERS AND THE HOMES THEY MAKE

Now of course you are all anxious to know what the proper conditions are. In a few plain facts we can make that point clear. For ages people have known that plants like clover and alfalfa left the soil in a better condition than it was before they occupied it. But it was not until about 1886 that the world knew why they did this. Nature has provided a large group of plants that seem to produce this beneficial effect upon the soil. These are the common legumes or pod bearing plants like peas, beans, clovers, alfalfa, and the like. But none of these plants can enrich the soil alone. There must be something else present, which unless we know is not liable to be given the credit for the real work. This something else is nothing more than our tiny friends again, modest about making themselves known, but nevertheless always on the job if we want them to be.

So there is a large group of them known commonly as the legume bacteria. They are responsible for the little knots or nodules found on the roots of legumes and it is in these that they do a very important work for us. While living upon the plants, they are ever busy tying up the nitrogen of the air in such a way that the plants can use it and instead of feeding upon the nitrogen in the soil, they use much of the nitrogen that is fixed by these tiny friends. Now, then, if it is the nitrogen of the air that is used to make these plants grow, and if the plants are fed to the stock of the farm, it is easy to see how we may build up a nitrogen supply in the soil at a very little cost. This much is necessary, that the crops be fed to the stock in order to get this benefit. Selling them would be just like transferring money from one pocket to the other. We would still have only so much money. And so selling the extra nitrogen in the crops would leave the soil about the same in its nitrogen content. We can hardly appreciate the work of these invisible friends, so silently do they operate.

And we must not forget this fact. It is only when the legumes have a good supply of nodules or nitrogen factories on their roots that they can benefit the soil, for these plants like all others can live upon the regular supply of soil nitrogen and so we may find clover plants that look perfectly healthy without even a single nodule upon their roots. This means that they are using the soil nitrogen and we cannot expect them to add more nitrogen to the soil. But man has learned to co-operate with nature and now we have ways of providing enough bacteria of the right kind so that the plants will become inoculated; that is, there will be formed on their roots these nitrogen gathering nodules.

The addition of these bacteria to the soil is called soil inoculation and we find that often times, and especially in the case of such crops as alfalfa and soy beans, it is a very essential factor in producing good results. And we find that these myriads of invisible friends are quite choice of where they work. Those that will form nodules on the roots of the soy bean will not do a similar job on the roots of the alfalfa plant. It is necessary that the right kind be added if results are to be expected. We cannot depend upon the numbers and kinds in the soil to do the work. Soils that have not grown certain crops like alfalfa and soy beans should always be inoculated for they are very liable to be very deficient in the kinds and numbers of bacteria that are needed by these crops. But where can we find bacteria to add to the soil? Science has made that easy for us now. There was a time when they could not be found as they are now.

Today all kinds of legume bacteria are grown in laboratories in a special way and all we have to do is to get them and then follow the directions that are supplied. And so today we

Save on Sweet Clover

Half the Price of Alfalfa or Red Clover

WRITE for our prices and FREE Sample before you buy. We have the genuine White Blossom Bi-ennial. Tested for purity in our Seed Laboratory. Positively the best you can buy. And we save you money on the price. Wonderful improver of run down, badly washed fields. Will grow where alfalfa fails. Cows feeding on it, give big increase in milk supply. Richer in protein than either alfalfa or red clover. Grows anywhere and gives early Spring and late Fall crops—just when green feed is scarce.

hear farmers talk about inoculating their alfalfa seed before sowing it. It means simply this, that they buy bottles of bacteria that will inoculate the alfalfa plants and sprinkle the organisms on the seed before it is sown. This carries them into the soil where they are ready to build the nodules on the roots of the plants as soon as they appear.

Junior Letters

Hoard's Dairyman Juniors:—I am ten years old and am in the fifth grade. I live on a farm of 80 acres. We have 17 head of cattle; 8 are milch cows and the others are heifers; also one horse. I have a Guernsey heifer of my own; her name is Blossom. She is nine months old. We had 5 pigs. We butchered 4 and have one left. We haven't any dog because once when we had one he bit off a cow's tail and my father doesn't want another.

We have 36 chickens and 2 roosters. They are beginning to lay now. They are Rhode Island Reds.

We have been having fine weather for December. It snowed about twice and the snow melted in a short while. We were picking stones and plowing last week. The night of December 13th the rain just poured and in the morning when we woke up we found the ground covered with snow. It has been very stormy for about two days.

I have a sister, 15 years old, whose name is Marguerite and a brother, Mike, who is 13 years old. I will write more some other time. Wishing you and the juniors good luck.

Wisconsin. Thomas Matsick.

Hoard's Dairyman Juniors:—I am eleven years old and am in the seventh grade. I like to go to school.

I live on a 160-acre farm. We have 15 milking cows. One is already dry and the others will be dry soon. We will have 18 milking cows next summer, as three of the heifers will come in after Christmas. I have a Holstein calf that is about a year and a half old. It is not a pure-bred but a high grade. I won many prizes at the last institute we had in our town. I did not have my calf there but had many other things. I wish some of the juniors would write to me. Box 67, R. R. No. 2, Coleman, Wis. Henry Gabriel.

Hoard's Dairyman Juniors:—I am twelve years old and in the seventh grade at school. I live on a 128-acre farm. We have our corn all husked and fodder in the barn. We opened our silo about two weeks ago. We are milking six cows at present. We have sixteen hogs and two sows. We have about 125 chickens. Wishing good luck to the juniors, I will close.

Ohio. Leslie Lautzenheiser.

Hoard's Dairyman Juniors:—I have a little lamb; her name is Micky and she is 8 months old. We are milking two cows now; my brother milks them. We have about 12 head of cattle and two young calves. One heifer came in fresh three days ago.

We have two ponies; their names are Bill and Kit. One of them is my brother's but she is lame now so he walks three miles to school.

We have 38 sheep and ten lambs. I raised my lamb on the bottle.

As my letter is getting long, I will close.

Good luck to the juniors.

My address is Ariel, Wash.

Frances Simmons.

Hoard's Dairyman Juniors:—I live on a 128-acre farm. I am eleven years old and in the 6th grade.

Papa has 24 cows, a pure-bred bull, and three heifers. I have a Holstein heifer and so has my sister. My heifer looks just like the one on the button I have. We have five horses and a Collie dog. The dog's name is Bowser. Mamma has some Rhode Island Red hens. We have a silo and it is 40 feet high. We filled the silo this year. I wish the juniors would write to me. My address is Box 120, R. 1, Kenosha, Wis. Peter DeGroot.

Hoard's Dairyman Juniors:—I received your very welcome letter and I read it with a great deal of interest. We are milking 19 cows just now and we expect a few more to calve. We are keeping all of the heifer calves as we want to keep weeding out our herd.

In your letter you stated that you were just harvesting your crops. Well, out here we are just putting in our oats, turnips, and maize. On the Pukekohe Hill, the farmers are digging their potatoes and selling them at 3 to 6 pence per pound. We have planted about half an acre of potatoes for our own use. The farmers are having a splendid year. There is any amount of pasture and what is better than that, we are getting a big price for our butterfat. I have read in the Dairyman that there is a large amount of lucerne or alfalfa harvested in your state. Out here alfalfa does not do so well as the roots can only go down so far, then they strike water. This makes it turn yellow and gradually the weeds smother it out.

The agricultural show which is held annually at Pukekohe has just recently been held and it was a great success. From our farm, we entered weeds on which we were able to get a first. I entered through our school in milk testing and was able to get a first also. I had hopes of being able to send a few photos with this letter but will have to send them later on as they are not yet printed.

My eldest brother persuaded my father to give the Shorthorns a run, so we obtained a few well bred cows and had them registered. A week or more ago we took a bull and three heifers in. We obtained for the bull, which was the top price paid, $300. At the yards, big prices are being paid for Jerseys, from $200 to $800, but they have to be very well bred. Guernseys are not very plentiful around here, but we have a half bred and she is one of our very best cows. The Holsteins are quite plentiful, but the farmers can't quite breed them to the average standard of others in your country. I saw some of your milking Holstein averages and they are a long way ahead of ours. My Jersey cow is doing fine and she is giving up to 50 lbs. of milk a day.

Auckland, New Zealand. Leslie Dyke.

Hoard's Dairyman Juniors:—I have written several letters which were not printed and I surely hope that this one will be. My calf is doing well now. She will be ten months old the fourth of this month. At the fairs she won six prizes, four special prizes, and two regular ones. My father has the money coming from the regular prizes and I have the rest. He has taken this to meet expenses. She brought me $31 in all.

I wish that some of the juniors would write to me. My address is Swanton, Vermont.

Murray Dunsmore.

Hoard's Dairyman Juniors:—How are all you juniors this winter? I am fifteen years old, in the eighth grade and I am carrying six studies. How did you come out in club work this year? I think that I did pretty well. My pig took first place at the county fair. The prize was a free trip to the State Fair. I sure did have a fine time down there. I saw stacks of fine exhibit corn and some of the fattest cattle that I have ever seen. My pig went along to the state fair and she took third prize down there. I sure do like club work. There is some good experience in it and some money too. So I am going to belong to the club again next year.

We are milking eight cows at present, three of which are stripperrs. We have a nice Jersey male. His name is Frolic Oxford Lad. We send our cream to Water Valley. We keep Plymouth Rock chickens. We kept a record of how many eggs we got last year. What do you suppose it is—five thousand, five hundred and twenty-one eggs! We started with sixty hens. In 1920, we sold one hundred and fifty-five dollars' worth of eggs and eighty-eight dollars and forty-five cents worth of hens and young chickens. I have a pair of Belgian hares which I intend to sell.

I live on a farm of 155 acres, but grandmother owns 40 acres of it. We have five head of horses and mules, twelve head of cattle, and twelve head of hogs. If any of the juniors want to write to me, my address is Walter Valley, Miss. Earl Barber.

Hoard's Dairyman Juniors:—I haven't written for so long that I just had to take the time today to write. We are milking twenty cows now. I don't milk now as I find plenty of work in the house to do. We have a milking machine but we do not use it. The men say that they can milk faster by hand.

I live on a farm of 200 acres. We have only four horses though and their names are Nellie, Flora, Mollie, and Fannie. We have about twenty calves so that makes about forty head of cattle. We have two hundred or more chickens and I don't know how many pigs, but I do know there are many of them; we shredded 25 acres of corn and in addition ten acres were husked.

There are five in our family. Two brothers, one 17 and one 15, twin brothers, and myself. The twins are seven years old. I always enjoy the stories that are on the junior page. I hope all of the juniors enjoyed Christmas as well as I did.

Minnesota. Hilda Maust.

Hoard's Dairyman Juniors:—In the letter which I recently received from the junior editor, I was asked to tell of my experiences in raising a calf this year. In the first place I will tell you about the feed and care which I gave my calf.

During the first month I fed her 16 lbs. of whole milk daily, gradually decreasing it until she was seven months old. I also gave her plenty of grain, clover hay, and some ensilage. The grain was a mixture of bran, ground oats, and some oil meal. I kept her inside all summer, providing plenty of fresh water at all times and I exercised her daily outside. I kept her stall clean and well bedded.

I brushed her daily and part of the time I kept her blanketed. She was clipped several times during the summer. Now I will tell you how I took care of her while at the state and county fairs. I kept her blanketed all the time while at those places in order to make her coat look nicer. I polished her horns with pumice stone and sweet oil. This was my first attempt at calf club work and the next time I expect to do better. Wishing all the juniors good luck.

Wisconsin. William Strusinske.

Sunday as a Day of Rest

Is it true that "there is no rest for farm women on Sunday," as Elizabeth Sears declares in her article "Who Feeds the Nation" in Harper's Monthly? Or has Miss Sears in mind conditions as they existed up to the last two or three years?

It is quite certain that the men rest on Sunday—and eat—and the women who cook the big Sunday dinners do not get much rest until they learn how to take the "short cuts" that save unnecessary work in hot kitchens. One of the most important of these "short cuts" is the new method of dessert making. In place of the heavy puddings and pies which have always accompanied the big Sunday dinners, fruity

JELL-O

desserts are served—desserts that are sparkling and beautiful and delicious beyond comparison.

These Jell-O desserts which just fit the Sunday appetite are made by dissolving Jell-O in boiling water. It is done in a minute, and adds a good many minutes to woman's share of Sunday rest.

There are six flavors of Jell-O: Strawberry, Raspberry, Lemon, Orange, Cherry, Chocolate, 2 packages for 25 cents by all grocers.

The new Jell-O Book is the most beautiful ever issued and it contains more useful information for housewives than any other. Send us your name and address and we will mail you one of the books, free, of course.

Wisconsin to Give Milk

The farmers of Wisconsin, as the result of a bounteous harvest and restriction of trade, find themselves with a surplus of food products, a supply more abundant than the markets can absorb. At the same time numerous nations are being underfed, many millions of our fellow beings are facing starvation, and liberal gifts and donations of our means are being solicited for this worthy cause.

Dairy products, the representative product of the farms of Wisconsin, are well suited to stand transportation for long distances and are the best form of food obtainable to meet these needs. Therefore we indorse the movement now under way asking each farmer of Wisconsin, in place of a cash contribution, to give one day's milk supply to feed those in need. We understand that many manufacturers of dairy products are willing to manufacture such donations, free of charge, into the finished market commodity.

The slogan adopted in this movement has been "Let us market our surplus in relief and take our pay in good will."—Wisconsin Farm Bureau Federation.

Test seed samples now to find what proportion you can count on when sowing time comes.

MARKETS

CHICAGO, Feb. 17—Butter—Creamery, 47c; standards, 45c; dairy, firsts, 38@45c; seconds, 25@36c.

Eggs—Ordinary, 30@31c; firsts, 33½@34c.

MORE PORK IN LESS TIME

Duroc-Jersey hogs have a tendency to put on great amounts of pork at an early age. They are easy-feeding animals, and raise large families. These hogs were introduced less than 50 years ago, and yet in 1918, 51% of all the hogs marketed in the country were "Duroc-Jerseys." They are uniformly red in color. Increase your profits by raising Duroc-Jersey hogs.

Write for "DUROC-JERSEY HOGS ARE PROLIFIC AND PROFITABLE"—sent free to hog-raisers by the largest swine record association in the world. Over 12,000 members.

The National Duroc-Jersey Record Association. Dept. 300 Peoria, Ill.

Greatest Labor Saving Dairy Barn Equipment Ever Invented

This Lever Locks Every Stanchion

YOU save a lot of time and hard work when you use West Bend Stanchions and One-Lever Control because one move does the work of fifty. Instead of going from cow to cow and locking or releasing each one separately, you stand at the head of the line and throw the lever once, operating all the Stanchions and Cow Stops simultaneously.

With ordinary equipment it is necessary to lock up and release each cow individually. With the West Bend Automatic Swinging Stanchions and One-Lever Control, **two to fifty cows can be locked in place as easily as one.**

One throw of the lever operates the entire row of Stanchions, whether it be two, ten, twenty or fifty. The West Bend way saves time, saves labor, avoids risks. You can release all the cows at one time, then stand at end of the line and see that they leave in a quiet, orderly way. Think how much easier, quicker, more convenient the West Bend way is. Yet, if necessary, West Bend Stanchions can be operated individually, and, if desirable, one or more cows can be kept in the stable when the others are released.

2112

Automatic Cow Stops

prevent the animal from getting its head in at the wrong place. In addition, West Bend Stanchions have a perfect line-up device and many other valuable points.

Greatest Features—Yet Costs No More

West Bend Barn Equipment costs no more than the "other kind." But there is no comparison in convenience and time-saving features. It is sold by leading dealers. The line includes Stanchions, Stalls, Pens, Litter and Feed Carriers, Water Bowls, etc.

Send Your Name for FREE Book

Send us your name on a postal and receive our big, illustrated Barn Equipment Book, also particulars regarding our FREE blue print, Barn Plan Service. Shows you how many money-making farmers are installing the West Bend Equipment. Write TODAY.

Stock Raising in WESTERN CANADA

Is as profitable as grain growing. Successes as wonderful as those from growing wheat, oats, barley, and flax have been made in **raising Horses, Cattle, Sheep and Hogs.** Bright, sunny climate, nutritious grasses, good water, enormous fodder crops—these spell success to the farmer and stock raiser. And remember, you can **buy on easy terms**

Farm Land at $15 to $30 An Acre

—land equal to that which through many years has yielded from **20 to 45 bushels of wheat to the acre**—grazing land convenient to good grain farms at proportionately low prices. These lands have every rural convenience; good schools, churches, roads, telephones, etc., close to live towns and good markets.

If you want to get back to the farm, or to farm on a larger scale than is possible under your present conditions, **investigate what Western Canada has to offer you.**

For illustrated literature with maps and particulars regarding reduced railway rates, location of land, etc., apply to Department of Immigration, Ottawa, Canada, or

Six Old Friends Whose Advice Has Helped Me

(Continued From page 217)

in that I am not certain it fattens my bank roll. When I secured my copy of this book I wanted to know more about milk and the changes it undergoes after leaving the cow's udder. Because I couldn't see the thing which soured it I was curious to know more about it. This book tells me. From its pages I learned the important relationship bacteria bear to dairying. I know something of how these tiny organisms grow and why—that there are good bacteria as well as those which injure milk. Once when we were having a good bit of trouble at our co-operative creamery because milk and cream were brought from the farms in bad condition, we called the worst offenders together and made good use of my knowledge of the "bugs in milk" in showing these patrons how to keep their product in good condition. I like to know why it is necessary to wash our cream cans after they are returned from the creamery. I have a new view of tuberculosis since reading the discussion of the possible contamination of milk by this disease organism. So, even though my cows may not give more milk because I read of the bacteria which grow in their product, I should not like to part with this book.

⚜

Perhaps other readers of Hoard's Dairyman have chosen other books for their dairy advice. It may be my "dependables" would not suit the reference needs of another dairy farmer. I do know these six, here on my desk, have been of very great assistance to me.

Iowa. HAWKEYE.

Influence of Profitmaking Through Testing Association Contagious

HOARD'S DAIRYMAN:—Snake River is the dividing line between Gooding and Twin Falls Counties, Idaho, but no such artificial barrier is effectual in restraining the contagious effects of a wholesome example. The farmers and dairymen of Twin Falls County formed a cow testing association in the fall of 1915, and, although somewhat tardy in recognizing the virtues of its sister county's organization, a cow testing association came into being in Gooding County in 1919. Thirty members and less than 300 cows constituted its charter membership.

With the elapse of barely twelve months, each member of the cow testing association was visited and requested to place an appraisal on the benefits having accrued to himself and herd of cattle by reason of affiliation with the organization for one year. Their individual responses would be interesting reading, but the massed benefits as represented by their total estimates are certainly imposing enough—$7,000, all told. Scattering pure-bred herds are included in the calculations but for the most part grade or scrub cows predominated. Operating expenses were figured at $1,500, leaving a margin of $5,500 favoring the maintenance of a cow testing association. The plans of the Gooding County association for 1921 are more elaborate than heretofore, the results achieved justifying an expansion which entails the employment of two testers instead of one. A bull association has been formed and its membership is in the market for pure-bred animals.

Walk a log or paddle a canoe across Snake River and you are inside the boundary limits of Twin Falls County, where a cow testing association

has been functioning for five years. Duration of time is not an inconsiderable factor in the operation of cow testing associations, when profits are increasingly large in relation to the age of the organization. At least this conclusion is warranted by the accomplishments of the farmers and dairymen of Twin Falls County compared to the results obtained by the cow testing association of comparatively recent formation in Gooding County. The Twin Falls County Association maintains 235 cows, yet, during the fiscal year of 1919-20, the number of pounds of butterfat was calculated to be 66,622.10, representing a gross financial return of $43,-970.58. The Gooding County Cow Testing Association yielded 49,332.44 pounds of butterfat valued at $33,-309.72. The marginal difference between the new and old organizations favors the latter by an increased butterfat production of 17,289.66 pounds, representing an enhanced income of $10,660.86. The significance of the difference is magnified in view of the comparatively few cows in each association.

The Dairy Division of the United States Department describes as lamentable the scarcity of cow testing associations in the far western states, when the tremendous value of the work is so obvious. The oft repeated but wholesome example of co-operative agricultural extension activities of Denmark are again to the fore. Approximately one-third (represented by 700 cow testing associations) of the dairy animals of Denmark operate under the discriminating view of official cow testers. The butterfat yield nearly doubles that of the average cow in America. "Is there any wonder she can undersell us on dairy products?" inquires the Dairy Division. There are approximately 2,-000,000 dairy cows in eleven western states, almost twice that of the cow population of Denmark, and yet only 50 cow testing associations have been organized.

Washington, D. C. S. R. WINTERS.

The Appearance of Cheese

Recently a week's make of cheese of the uncolored twin type was delivered at a warehouse unboxed. This particular lot of cheese was well made, well finished, and uniform in size. The quality was good and the appearance would have been especially pleasing and attractive had the cheese been boxed at the factory and delivered in a clean, bright condition. As it was, every cheese had become more or less dirty and soiled due to careless handling in hauling from the factory to the buyer's warehouse.

There may be exceptional cases where boxes cannot be obtained that it becomes necessary to have the cheese leave the factories unboxed. At such times every effort should be made to protect the cheese from coming in contact with unclean surfaces and every care given in handling to avoid a soiled and damaged appearance.

In some parts of the state, the practice of sending cheese to the buyers unboxed has become a habit and a bad one. The usual excuse is that boxes cannot be secured at the factory. This may be true in a few instances but I find that the small saving made in avoiding hauling charges in the delivery of boxes at the factory is most generally the real reason. It is appreciated that factory operators have been forced to economize in every way to be able to continue in business, but such economies as result in marketing cheese in any but the best possible condition as to finish and appearance are false and can only eventually result in permanent loss and injury. Makers, operators, and others engaged in the production of cheese must realize that the finished appearance of the cheese and the package play an important part in the marketing of our products.

There never was a time possibly when there was such a need for better cheese both in quality and finish than at the present time. The markets are loaded with inferior goods but the best grades can always find a place. With the coming of lower prices there always comes a greater discrimination on the part of the buyers as to quality and the maker who cannot or does not give every attention to the appearance of his goods and to the quality will get less and less consideration from the buyers of their products.—Wisconsin Dairy and Food Commission.

Take Pride in Your Barn—Make Real Profit Out of It

You wouldn't bind wheat by hand in these days of labor saving machinery. Then why do you house valuable dairy cows in wet, dirty, old-fashioned stables and expect to get the most out of them?

No matter how few or how many cows you own, STAR Equipment will make money for you by cutting labor costs, helping herd health and increasing the milk yield.

Any modern equipment is good, but numerous patented features put STAR in a class by itself. The Star Unit System permits you to add stalls as you buy more cows. The Curb Clamp cuts installation cost—the Alignment Device saves work—these are a few of many Star exclusive features. Investigate for the sake of owning a barn you can be proud of, both from a standpoint of "looks" and profit

The Star Line is not confined to Steel Stalls, Stanchions, Water Bowls, Pens, Ventilation Fixtures, Litter and Feed Carriers, but also embodies Harvester Hay Tools, Cannon Ball Door Hangers, Hoghouse Equipment, Garage Door Fixtures and all kinds of farm specialties. It takes a 320-page catalog to tell the Star story.

Your name will bring the finest catalog ever issued—a 320-page bound book worth owning for the useful information it contains. The only expense to you is the trouble it takes to write

Hunt, Helm, Ferris & Co.
Everything for the Modern Barn
Harvard, Illinois Albany, New York

STAR Equipment

1 Star Alignment Device
Instantly lines cow at gutter after she is in stall—keeps stall, bedding and cow clean.

2 Star Stanchion Adjustment
Narrows or widens stanchions to exactly fit cow's neck. Safety and comfort.

3—Star Curb Clamp
"Sets a stall in 60 seconds"—permits of concrete work being finished before stalls are set Cuts time of installation in half.

4—Star Unit System Stall
Each stall assembled before shipment, ready to go in place the moment it arrives.

5—Star Wood Lining
Hard maple lining forced in U bar, anchored so it won't come out.

RIVAL STOCK FARM, Laurens, Iowa

Washington D. C., Weekly News

(Continued From page 220)

association has not found it possible to use the butterfat basis of sale owing to the impracticability of making the necessary tests and this will be overcome by the establishment of a central testing laboratory in connection with the new plant. Another feature to be added is a plan of looking after lost cans. With these two innovations working directors of the association believe that the cost of the plant can be repaid in the annual saving to members.

The controversy over the entry into Washington of milk and cream from New York has reached the legal stage and the first round was won by the milk dealers' representatives seeking to open the doors of the Capitol to the milk and cream shipped here by the Merrell-Soule corporation of Syracuse, and coming from untested dairies in that state. Justice Gould in District Supreme Court this week handed down a preemptory writ of mandamus, directing District Health Officer W. C. Fowler to grant the necessary permit for this milk to be received and sold here. The case involves the validity of the health regulations of the District of Columbia which provide that milk from cows not tested for tuberculosis, and found free from that disease, can not be sold here. The Merrell-Soule Co. presented applications from 182 New York farmers for permission to ship milk here, and it was admitted that these New York dairies were not tuberculin tested. Dr. Fowler refused the permits. Justice Gould in granting the mandamus, approves the contention of the plaintiffs, that "there is no law in the District of Columbia which requires the tuberculin test".

Dr. Fowler will appeal the case, it is understood, his attorneys contending that his ruling comes within the powers which he holds by virtue of his office, and therefore has all the effect of law.

The case is being fought by attorneys for local milk dealers who sought, when the case was started, to get this supply of milk and cream at a time when the supply here was short, and the Maryland-Virginia association was insisting on its advance price contract for the winter months.

Dispersal Sale

100 HEAD Registered Holstein-Friesian Cattle

Friday, March 18, 1921

At 10:00 A. M. Sharp.

Linside Farms and personal property are sold. This great herd must be disbanded after fifteen years of careful breeding with 30-lb. sires at head of herd.

Rag Apple Korndyke 20th 204631, sired by Rag Apple Korndyke with 51 A. R. O. daughters, one 37 lbs. and whose dam is Mutual De Kol, the 30-lb. show cow with 2 A. R. O. daughters is now in service. The whole breeding herd with A. R. O. records up to 27½ lbs. butter 7 days with a lot of two-year and yearling heifers by 30-lb. sires and bred to a 30-lb. bull with the 1920 crop of heifer calves and three young bulls from A. R. O. cows will form a wonderful opportunity for buyers to fill their needs. Herd Federal tested with 60-day retest privilege.

Farms one-half mile north Unionville, reached by stone roads and trolley; ample hotel accommodation in West Chester.

The Second of A Noteworthy Series

— Make Your Plans to Attend

PABST SALE — SURPLUS ANIMALS — APRIL 2nd

Pabst King Pontiac Lad will be sold. He is one of our herd sires. He is a son of Pabst Hengerveld DeFreule that has just made over 39 lbs. in 7 days. He is a full brother to Pabst Champion DeFreule that has just made over 37 lbs. in 7 days and 151 lbs. in 30 days. We have 49 of his daughters in our herd and 30 cows safely in calf to him. He is the highest record son of King Pontiac Champion ever sold. His breeding and individuality should place him at the head of some great herd.

28 Young Bulls—15 Cows

Young bulls in the sale will include some of the very best we have ever bred, including fifteen by Creator and nine by Pabst King Pontiac Lad. Practically all these bulls are from splendid record dams that will have greater opportunities. One son of Creator is from a 29-lb. and almost 900-lb. daughter of "Champion," another is from a 21-lb. 2-year-old daughter of Champion Dora Korndyke, champion Holstein cow for two consecutive years' production, another is from Pabst Ivy with 34.21 lbs. in 7 days and a good yearly record, another from Pabst Kinnickinnic with 35.50 lbs., twice over 34 lbs. and three times over 32 lbs.

29 bulls of this class will be sold.

The fifteen young cows and heifers in this sale will furnish an excellent opportunity to procure desirable foundation cows, in calf to good sires. Practically all of milking age have records, are from good record dams, by noted sires and in calf to one of our herd bulls. Seven of them are in calf to Creator. Never before have so many been offered in calf to this great sire. There will be daughters of Maplecrest King De Kol, Woodcrest Clyde, King Pontiac Champion, King Pietertje, Pabst Pontiac Hengerveld and Korndyke Segis Johanna.

Remember that Pabst Stock Farm won first place last year as breeder of prize winners. The animals it sells to others make good for them. In buying at this sale you buy the blood that is represented in many of the prominent herds.

Be sure to get your name on the catalog list now and send for full information on this sale. It is our second semi-annual.

Holstein Bulls At Farmers' Prices

We are not in the game to get rich but to help promote the breed by offering pure-bred bulls at the lowest prices, enough to cover raising. Write for prices and descriptive list. The Ormsby kind.

RAMSEY COUNTY HOME,

J. E. McMahon, Supt., North St. Paul, Minn.

Ohio Farmers' Round-Up

(Continued From page 221)

necessary vitamines to induce growth. The manner of raising orphan pigs has considerable economic importance in Ohio, while the correct selection of feeds for fattening hogs determines whether the farmer will have a profit or loss at the end of the feeding season. The cereal proteins are generally lacking and must be balanced with tankage, oat meal, or fishmeal. The legumes are valuable in the ration because the leaves of legumes furnish the needed vitamines and are low in fiber. Calcium and phosphorus are the two essential mineral elements needed most in the hog's ration. These may be supplied by feeding steamed bone meal, to make it, perhaps, one per cent of the ration. It is sometimes necessary to mix this with tankage in order to make it palatable.

100 Bushels-to-the-acre Corn Club

Eighteen Buckeye corn growers were elected to membership of the 100-bushels-to-the-acre Corn Club and were given gold medals during the Farmers' Week session. The highest yield of the contest was 123.24 bushels per acre secured by Leslie Brown of Highland County.

The average yield of the 33 men finishing the contest during the past season was the highest since the contest started 4 years ago. The average was 89.64 bushels. In 1917 when 41 finished, the average yield was 68.52 bushels; in 1918, the average yield of 42 contestants dropped to 63.45 bushels; and in 1919, the average of 32 contestants was 87.58 bushels.

The Ohio Farm Bureau holds its annual meeting during Farmers' Week. Their plan this year was to organize a governing body composed of 22 Ohio farmers, each representing a district of 4 counties, and each chosen by his own district, with the assistance of 3 women, chosen at large during the annual convention. The districts have been increased from 8 to 22. Farmers' organizations in Ohio are harmonious. There is no lost effort through friction or rivalry; no duplication of time or labor and team work is planned and done, the result being a perfect correlation of all activities that seek to promote the interests of the farmers. O. E. Bradfute, vice-president of the National Farm Bureau Federation, was elected president of the Ohio Farm Bureau.

Western Associations

(Continued from page 225)

er, states that the average production per cow for 1920 was 336.5 lbs. of fat, the total number of cows being 249. The high herd of the association contains 14 cows averaging 454.4 lbs. fat. He compares six herds where production as determined by test records was used as a basis for the feeding and management, and where grain was consistently fed, with six herds where poor feeding and care were practiced. The first six averaged to produce for the year 2,109 lbs. of milk per cow more than the cows in the second six herds. There was a benefit of 141.6 lbs. of fat per cow from the good feeding. The first six herds averaged $53.18 more returns above feed cost than did cows in the second six herds.

An increase of $30,000 per month is claimed by George Knight, tester for the Los Angeles Association, which has 3,000 cows. This claim is based on records which show the average fat production per cow for December, 1920, to be 36 lbs. and that for December, 1919, to be 28 lbs. This 24,000 lbs. butterfat at $1.30 per pound (which is the whole milk price for fat in Los Angeles) equals $31,200. Cups and medals to the value of $1,000 are offered in this association in 1921 for the best records made.

In a cow testing association at Santa Ana, California, a member culled 13 cows from his 45-cow herd and decreased his production only 12 gallons per day. In doing this culling he saved $60 per month.

From the western office of the Dairy Division comes a report of cow testing associations in the West, in which six associations are listed as "one hundred per cent", meaning that all of the members in these six associations own pure-bred bulls. Three associations are in Idaho, two in Colorado, and one in Washington.

C. Wiborg, tester in the Petaluma, California, Association, states that only two scrubs are left since February 1st. The Wahkiakum Association in Washington finished its year "one hundred per cent" but in reorganizing added new members which own scrub bulls. The Bandon Association in Oregon has members which own 18 pure-bred bulls and 19 scrubs.

A study of herd improvement work covering a period of ten years has shown us that when properly conducted the work of a cow testing association benefits its members. A proper understanding of the work proves this claim to be true in hundreds of instances. Hundreds of successful dairy farmers take a just pride in referring to the time they first joined an association. Usually it takes only a few months' work to create within them a desire to own a higher producing herd of cows. And when one begins studying along these lines—in most cases—he is sure to develop a broader mind, a wider vision, and better judgment which means a better farm home and a better citizen.

Wisconsin. FRANK LYNN.

Jersey Cattle Notes

For week ending February 4:

Number of animals registered: bulls, 250; cows, 663; total, 913. Number of transfers recorded: Bulls, 127; cows, 535; total, 662.

THE EXPERT EXPLAINS

How Plenty of Fresh Drinking Water

INCREASES MILK PRODUCTION

There must be liquid to make liquid; and the more water a cow drinks, the more milk she will give. That has been proven. Your outdoor tank in cold weather freezes—or the water is so cold the cows will drink but little. In summer the water is stale or too warm—and they won't drink much of that.

Fresh, pure water—*direct from the well*—is the kind the cows like—the kind they drink lots of—the kind, therefore, that *increases milk production.*

That is what a Milwaukee Air Power Water System will give you—for bowl or feed trough. And it will enable you, without trouble, to keep the cow barn clean, avoiding danger of disease and infection and loss of profit by milk refused on account of uncleanliness.

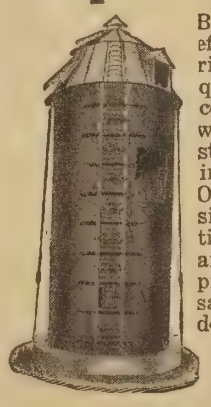
This is one of the ways in which a Milwaukee Air Power Water System actually *pays* in dollars and cents. There are many other ways. Find out about them. Write for our big new, free catalog. Find out all about the system—how it can be installed on your farm, how it operates, how it benefits you—and what other practical farmers say about its *paying* features. And we will send you the name of our Water and Light Expert near you.

Write us *today*.

MILWAUKEE AIR POWER PUMP CO., 876 Third St., Milwaukee, Wis.

Milwaukee

Air Power WATER EITHER OR BOTH LIGHT Systems



DIRECT FROM THE WELL— always fresh and pure

FROM THE SAME POWER— installed with the water or later

Let us send you the name and address of the Water and Light Expert— our representative—who lives near you. He will help you figure out a practical system for your farm—without charge for his investigations.

INDEPENDENT

Triple Wall Silo

Built for service and efficiency from materials of very best quality—Three Wall construction. Inner wall 2x6 vertical staves, Middle wall, insulating silo-felt, Outer wall, End-Lox siding. No hoops to tighten. Air tight and practically frost proof. Over 10,000 satisfied owners endorse it.

"High-Priced" Unicorn Makes Low-Cost Feed

Feed this way with clover hay

For November, four out of the ten highest cows in all Indiana cow testing associations were fed Unicorn.

Average milk . . 1609.5 lbs.
Average fat . . . 59.9 lbs.

Those who are not feeding Unicorn say that it is "high-priced."

Those who *are* feeding Unicorn say that it gives them a greater profit than they can get with any other feed.

The Unicorn feeders know that it's not the price of a thing that counts, but how much you get for your money.

There's more milk *and more profit* in a ton of Unicorn than there is in a ton of any other feed—home-mixed or boughten.

Use Unicorn and cut down your feed bills. Goes farther. Lasts longer. Actually *costs less*—not more.

The Home Grown Ration

(Continued from page 218)

to water, or providing her in some manner with an abundant supply of it, is an important part of her requirement. In passing, it will be a matter of interest to note that she requires, in addition to the dry matter consumed, approximately 150 pounds of water daily.

Our experiment stations, with their trained research workers and laboratories, are in a position to tell us many interesting facts about the feed consumption, milk production, and nutrition requirements of dairy cows. Results of carefully weighing and checking the feed consumption and milk production, taking into consideration the waste materials that pass from the body, and further noting the change or constancy in the live weight and the health and tone of cows, are the basis of several feeding standards familiar to many dairymen, and used in a general manner for calculating the "balanced ration" for dairy cows.

These feeding standards, for example, tell us that a cow weighing 1,000 pounds in dry condition will require the equivalent of 30 pounds of silage and 8 pounds of clover hay. Feeding standards express this fact, however, in a statement of the dry matter, digestible crude protein, and total nutrients which the cow will require. For example, 30 pounds of corn silage and 8 pounds of clover hay contain approximately 12.5 pounds of actual dry matter, which include .7 of a pound of digestible crude protein and a total of 7.9 pounds of digestible nutrients. The amount of protein in this ration is 8.8 per cent of the total digestible nutrients. The cow in question, in a fresh condition, and making 50 pounds of 4 per cent milk daily, and requiring the equivalent of 40 pounds of corn silage, 11 pounds of clover hay, and 15 pounds of concentrate mixture, will be getting the equivalent of 30.9 pounds of dry matter which contains a total of 23 pounds of digestible nutrients and 3.42 pounds of digestible crude protein. The protein in this case amounts to 15 per cent of the total digestible nutrients.

The marked difference in the rations for the 1,000-pound cow when dry and when producing at the rate of 50 pounds of milk daily, in terms of farm feeds or the research worker's terms of dry matter, digestible protein, and total digestible nutrients, brings out the fact that the nutrition requirements of cows must necessarily vary in proportion to their milk production capacity. A further study also teaches us that these requirements vary with differences in live weight, disposition, or temperament, or other characteristics of cows, and their conditions of environment. In the preparation of rations to meet the requirements of cows, one must take into consideration the composition of various feeds with reference to the available digestible nutrients which is influenced by the amount of crude protein, referring to the nitrogen compounds of the plant, the carbohydrates representing principally the starch and sugar compounds, and the fat which we naturally think of as the oil of plants.

As practical dairymen, we are familiar with the class of feeds like clover and alfalfa hay, oil meal, cottonseed meal, gluten feed, dried distillers grains, brewers grains, and others which we naturally class as highly nitrogenous or protein feeds. The practical herdsman, in mixing feeds and preparing his rations, naturally likes to combine a variety of these feeds with the farm grown cereal grains which are naturally rich in carbohydrates and fairly rich in fat. He thus prepares the "balanced

ration", or what we have come to call perhaps more frequently, a "complete ration", which is most efficient in supplying the requirements of the cow.

Protein in the Dairy Ration

We hear much about protein in rations for milk production and of protein requirements of dairy cows. Because of the importance of protein in its relation to the nitrogenous tissues of the body, which constantly have to be repaired from protein compounds in the feed, such tissues, for example, as the hide, hair, horn, hoof, and connective tissues of the body; and furthermore the relation of protein to the casein or cheese part of milk, protein being its principal source, this compound may be regarded for Wisconsin conditions, at least, as the most important factor in dairy rations.

Just at this time we also hear considerable about the "kick" in old time and substitute drinks affected by prohibition measures. Protein seems to be the "kick" that many rations lack for stimulating milk production. Cows producing daily one-half to two pounds of butterfat will require approximately 1.5 to 3.5 pounds of digestible crude protein. An analysis of rations found on the average farm will show a great variation in the amount of protein they contain. The production of cows vary accordingly in most instances, and too often are below their possibilities in milk production, because of too small an amount of protein being fed, or having been fed at a time in their lactations when it was necessary to properly maintain the cow and support her in the production she was capable of making.

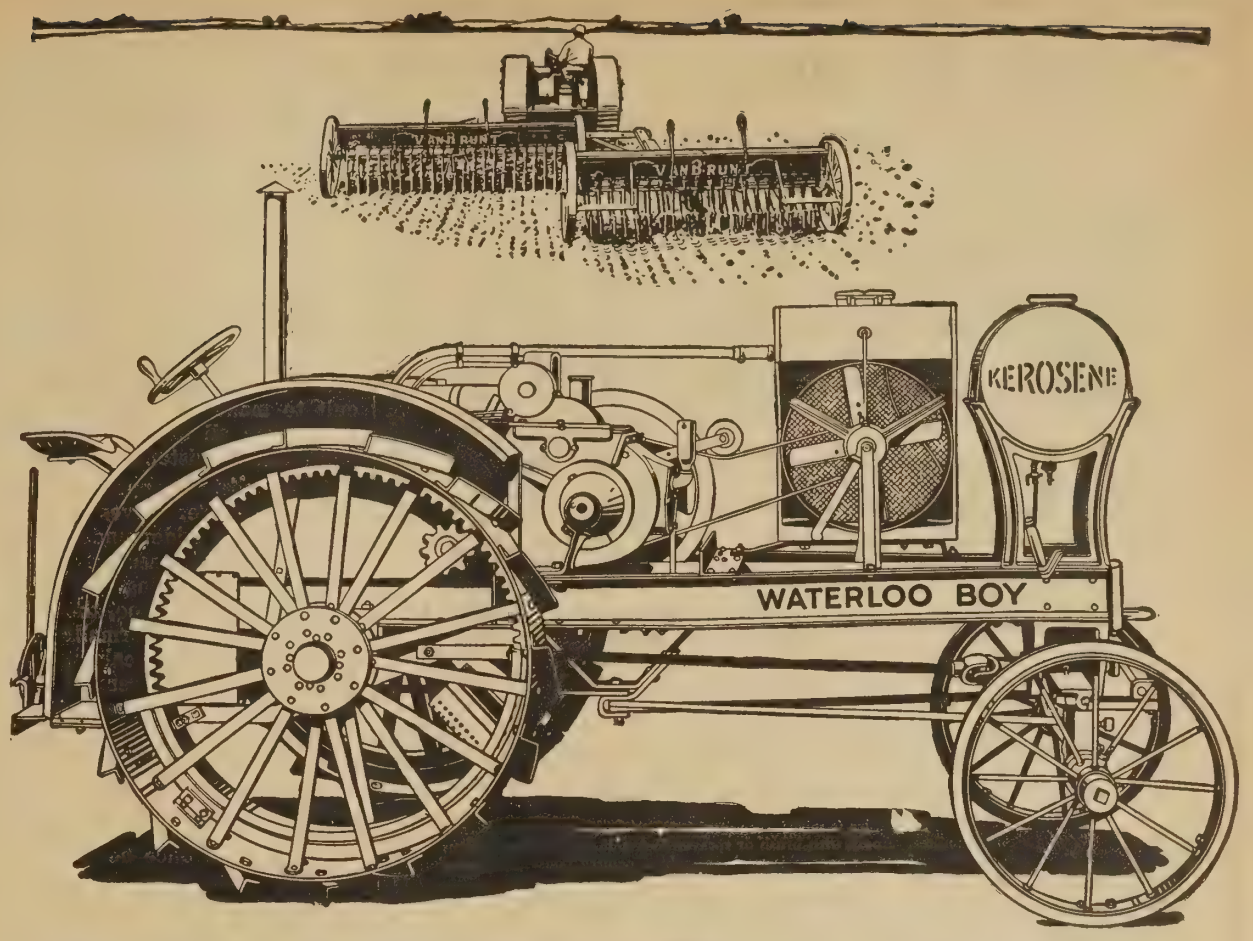
Proteins Variable in Efficiency

Scientists, furthermore, inform us that all proteins are not alike. They have demonstrated that the quality of proteins in different feeds may vary greatly in efficiency under certain conditions. Hart, of our Wisconsin station, in a trial with dairy cows, using corn silage, corn stover, corn meal, and starch as a basal ration, and at different periods supplementing this ration with distillers grains, gluten feed, oil meal, skimmilk powder, and casein, respectively, all relatively high protein feeds, showed that the relative percentage efficiency of these feeds for taking care of the needs of the cows with reference to protein requirements was 45 for gluten feed, 61 for oil meal, 60 for distillers grains, 59 for casein, and 60 for skimmilk powder.

In a later trial where clover hay was substituted for corn stover in the basal ration, gluten feed as a source of protein appeared equal to oil meal, distillers grains, or cottonseed meal. Again, later, where alfalfa was used with corn silage, corn meal, and starch as the basal ration, oil meal and gluten feed showed equal value as protein supplements, while cottonseed meal fell short to as low as 28 per cent efficiency and distillers grains rose to the high point of 50 to 53 per cent merit as one of the four feeds. These trials justified the popularity of distillers grains when they were available and the eagerness with which they were sought by dairymen for test rations.

(To be concluded in next week's issue)

Calls for Discussion of Chlorophyl



HOARD'S DAIRYMAN:—I would like to see a discussion taken up in the Dairyman by some chemist or botanist, who is well qualified to do so, as to why we get so much greater results from feeding a green forage crop.

The "green" substance or chlorophyl, which the microscope reveals moving through a living plant, undergoes some change in the process of curing a crop. We are coming to realize that pasteurized milk has lost something, that some vitamines have been changed or destroyed.

Now may we not eventually come to discover that something in the chlorophyl, or green substance of plants, has been changed or destroyed in the process of sun curing?

It is a matter of common observation that a plant has more perfect milk-producing and body-sustaining power when fed green feeds. Most of this power seems retained in silage. The more of a green cure we can get on hay, the greater its palatability and feeding value. In the process of sun curing, are there some life giving properties that might be called vitamines changed or destroyed?

Bloomville, N. Y. L. P. G.

Only $5 for Repairs in Six Years of Service

THE makers of the Waterloo Boy Tractor do not consider it enough that their product is dependable and gives efficient service. They have built it into another feature which means much throughout the years of its profitable use. That feature is Waterloo Boy economy—not only in the use of fuel and oil, but for general up-keep and repairs.

WATERLOO BOY KEROSENE TRACTOR

Back in 1914 Mr. E. F. Rowe, a farmer living near Hampton, Iowa, bought a Waterloo Boy Tractor. It was one of the earlier models put out by its builders. Its gears were not enclosed, its bearings were of the plain type—it lacked many of the improvements found on the present Waterloo Boy.

Mr. Rowe used his tractor for all his field operations and for most of his belt work. In checking up his expense last fall, he found that he had spent but approximately $5 for repairs during his six years of ownership. **Only $5 for repairs during six years of dependable, efficient, service.** And it is still going strong.

This is but one instance of Waterloo Boy economy. There are many, many others. Improvements on the present Waterloo Boy make it a great deal more economical than the one Mr. Rowe owns. The gears are now enclosed and run in oil, Hyatt roller bearings at all important points reduce friction and add to its long life. Every feature of construction makes for economical up-keep and operation.

Find out what a Waterloo Boy Tractor will do for you on your farm. Try it out. Your John Deere dealer will be glad to co-operate.

The Waterloo Boy Tractor and the John Deere No. 5 Tractor Plow make a reliable plowing outfit.

Write for a folder describing the Waterloo Boy fully. Also ask for Better Farm Implements, a 114-page book illustrating and describing the John Deere full line of farm tools. It's free. Address John Deere, Moline, Illinois, and ask for Package WB 714.

Use CARBOLA
The Disinfecting White Paint

Instead of Whitewash and Disinfectants

Carbola is the most effective as well as the cheapest and easiest way to obtain the necessary sanitation. It is a paint in powder form which contains a germicide many times stronger than pure carbolic acid. A peeling whitewash means not only loss of light, but loss of the disinfectant sprayed on the whitewash that peels off. Carbola does not peel or flake—it stays on the wall, a day and night guard.

Makes it Easier to Do Work that Must Be Done

The Carbola powder is mixed with water and ready to apply in less than five minutes. Apply with brush or sprayer to wood, brick, stone, cement or other surfaces, or over whitewash, in stables, poultry houses, hog pens, cellars, outbuildings—wherever you have been using whitewash and disinfectants or just whitewash. A gallon (a pound of the powder) covers 200 square feet. Also an excellent lice powder—use it in the dust bath.

Your hardware, paint, drug or seed dealer has Carbola or can get it. If not, order direct — prompt shipment by parcel post or express. Satisfaction, or money back.

10 lbs. (10 gals.) $1.25 and postage. 20 lbs. (20 gals.) $2.50
50 lbs. (50 gals.) $5.00 delivered.

ABORTION IN CATTLE

CAN BE TREATED SUCCESSFULLY AND YOUR COWS MADE PROMPT. REGULAR BREEDERS BY

STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for **FREE BOOK.** It explains the causes and symptoms of Abortion and tells how to treat Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00 plus 4c tax. Mailed Postpaid, in plain wrapper.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Suppression of Milk (Agalactia)

There are several phases of this subject which may be touched upon briefly and all of them deeply concern the dairyman who finds it difficult to make market milk profitable even when all of his cows milk normally and persistently.

It is most disappointing when a well bred heifer calves for the first time with her udder undeveloped and milkless, and all cases of suppression of milk are annoying and expensive. In some instances, too, the udder apparently develops normally yet gives little if any milk at calving time and treatment fails to remedy the condition. Failure of the udder to develop in a heifer from heavy milking ancestry indicates congenital derangement of the nerve and blood supply of the part and such condition is, as a rule, hopeless so that the animals should at once be fitted for the butcher. In rare instances milk gradually secretes and increases in amount, if the udder is massaged thoroughly several times daily and the teats manipulated as if they gave milk, but it scarcely pays to give such treatment. When the udder is fully developed, yet fails to secrete milk, the measures we have suggested may, however, succeed in a fair percentage of cases, especially if some milk is secreted from the first. Many dairymen believe that in such cases, allowing a calf to nurse will, in time, be likely to stimulate full milk secretion.

Sudden shrink in established milk flow quite commonly results from shock, fright, chill, running, a long journey, change of milkers, weaning of a calf or an attack of indigestion or other disease. Persistent failure to yield normal quantities of milk usually suggests inadequate feeding, dry pasture, fly torment, lack of drinking water, or some such cause. Prompt removal of the cause may quickly be followed by restoration of normal milk secretion and other measures of relief prove beneficial. They consist in placing the cow in a comfortable box stall, blanketing her warmly and giving copious warm drinks of flaxseed tea, hay tea, and thin, nutritious gruel well sweetened with blackstrap molasses. In cases of chill ground ginger or essence of ginger should be added and in other cases it always is well to give 30 to 60 drop doses of fluid extract of nux vomica 2 or 3 times daily along with ½ to 1 ounce doses of such galactogogues as powdered fennel, anise seed, and juniper.

It sometimes happens that a cow that has been giving a full flow of milk suddenly ceases to do so, suppression being complete at the second or third milking. Careful examination may discover no apparent cause for this occurrence and the cow appears to be perfectly well in every way. There is no history of shock, fright, chill, or anything else that might have upset the nervous system. The milk simply stops secreting indicating failure of the trophic nerves to function. The customary treatments mentioned above wholly fail in this class of cases, but if a qualified veterinarian can at once be employed to administer alkaloidal drugs, such as strychnin and pilocarpin, milk secretion may quickly be reestablished.

Other causes of shrink in milk or partial or complete suppression are the various forms of mammitis which will be discussed in subsequent articles.

Cornstalk Disease

Please write me in full what is cornstalk disease in cattle.

Elkador, Ia. G. G. W.

The term "cornstalk disease" is not specific but is used to describe any malady that quickly kills cattle pasturing cornstalk fields. In many instances hemorrhagic septicemia is the actual disease present and may be correctly diagnosed by post mortem examination and if necessary laboratory tests. In that event vaccination will be in order and usually is worth applying on general principles when the cattle are dying of the so called cornstalk disease. In some outbreaks cattle are killed by forage poisoning or impaction of the rumen or poisonous matters in the dry stalks. The veterinarian has to determine the exact nature of the disease in each instance.

Dysentery

I have a registered Jersey bull 17 months old. When I first got him I fed him a grain ration of three parts corn, two parts oats, and one part middlings, about six pounds per day, and clover hay. He did well for about six weeks when he developed scours. I had our local veterinarian treat him for about a month but he has been unable to do him any good. I finally discontinued the grain ration I had been feeding and gave him about a gallon of bran a day and timothy hay, but it has not helped him much. I also kept him in stall for several days and fed him nothing but hay. Early in the morning his bowels seem to be in fairly good condition but by night he scours again.

Clarksville, Tenn. L. F. S.

It is to be suspected that the bull is afflicted with Johne's disease, also called chronic bacterial dysentery. It is an incurable, contagious germ disease and eventually proves fatal. The appetite is retained but the animal becomes emaciated despite good feeding. Suspected animals may be tested with Johnin, similar to tuberculin, to determine if the disease is present.

For Barrenness in Cows, Mares and Sows, Use Hood Farm Breeding Powder

Astonishing Success in Making Barren Animals Breed — Indispensable After Abortion — Invaluable Where Cows do not Clean — Profitable to use on Every Cow After Calving.

Read what they say:

Mr. C. E. Brooks

Brooks' Rupture Appliance

Has automatic Air Cushions. Binds and draws the broken parts together as you would a broken limb. No salves. No lies. Durable, cheap. Sent on trial to prove it. Protected by U. S. patents. Catalog and measure blanks mailed free. Send name and address today.

Brooks Appliance Co., 467 B State St., Marshall, Mich.

Dehorning is Cruel The easy, humane way to avoid horns on cattle is to treat calves 3 to 10 days old with **Fleming's Chemical Hornstop.** 50c tube pp. One application stops horn growth.
FLEMING BROTHERS, 255 Union Stock Yards, Chicago

This preparation has been made and used with fairly good results at the Wisconsin Agricultural Experiment Station. Possibly your veterinarian may be able to arrange for such a test. Meanwhile try the effects of a dram of subnitrate of bismuth and two drams of oil of eucalyptus given twice daily, and then oftener if found necessary.

Lameness

I have a mare twelve years old which becomes very lame in front feet by spells. Sometimes she will be all right for several days, then lame, makes no difference about work on the road. They come on when not working at all. She moves like a horse that has just been foundered until she has gone about a mile then is all right until she stands a few minutes.

Hanna, Ind. G. H. W.

The symptoms suggest navicular disease, but that most affects road horses and requires unnerving as the only means of removing the lameness. In a draft horse, sidebones would be a more likely cause of lameness but it aggravates with exercise.

We conclude, therefore, that the lameness must be due to rheumatism. If you cannot employ a veterinarian, clip off the hair and blister the hoof head and fetlock joint with a mixture of 2 drams each of biniodine of mercury and powered cantharides and 3 ounces of lard. Rub it in for 15 minutes and then smear some of the ointment upon the blistered surface. Tie the horse up short. Wash blister off in 48 hours and then apply a little lard daily. Blister the other leg a week after the blister has been washed from the other one. The blistering may be repeated once a month if seen to be necessary. At times of attack, also give the mare a dram of salol three times daily. Keep the mare in a dry, light, well ventilated stable.

Depraved Appetite

I have a pure-bred Jersey heifer 2½ years old milking in first lactation that will frequently lick red clay earth and sometimes chew and swallow small clods of clay dirt. What does her system crave? She gets all the alfalfa hay she will eat, although she doesn't eat as much hay as most cows do.

McShan, Ala. C. E. B.

Allow the cow free access to rock salt and, if possible, a succulent feed such as roots or silage. If the trouble persists, add bone meal or precipitated phosphate of lime to the feed, starting with a tablespoonful twice daily and increasing the dose if found necessary. Half an ounce of bicarbonate of soda given twice daily in water often proves remedial.

JERSEYS

JERSEY BULL
Ready For Service

Dropped July 25, 1919. Solid dark fawn, black tongue and switch. Sophie 19th of Hood Farms
World's Champion Long Distance Dairy Cow

9 years R. O. M. records total 110,918.1 lbs. milk, 6,356 lbs. fat, 7,945 lbs. butter 80% fat. Now on tenth yearly test in sixteen-year-old form. Has made in four months 5,137 lbs. milk, 295 lbs. fat. We offer grandsons of this World's Champion cow. They will sire size, production, constitution, longevity. Write for description and pedigree of bulls and bull calves. Prices from $200.00 and up.

HOOD FARMS, Inc.
Lowell - - Mass.

N. B. Over a quarter century breeding Jerseys for large size, heavy production, strong constitution, longevity and profit, enables us to offer you a bull that will sire profitable producers. Our correspondence is very large, to save time and correspondence, we would appreciate your writing us priced bull you wish to purchase, and we will send full information on more than one for your consideration.

JIMMY DODGE, Mgr.

Jersey Cows
For Sale
FROM FEDERAL ACCREDITED HERD

I have six cows for sale with Register of Merit records from 400 to 500 lbs. butterfat, age from 3 to 8 years. Prices from $250.00 up. One of these is a daughter of Noble's Fawn Prince, record 493 lbs. Five will freshen between January 5th and April 15th. These are all good individuals of right type.
P. G. WARMINGTON, Honey Creek, Wis.

Pine Lawn Dairy Farm

is offering 2 young bulls out of high producing cows. One, a grandson of Golden Maid's Viscount, 18 months old. One, a son of Beauvoir's Chief; he a son of Western King's Chief. Also a few cows and heifers. Write for pedigrees. Will sell cheap to make room.
H. S. Hager, Prairie du Sac, Wis.

HERE'S YOUR OPPORTUNITY
Bull calf born March 4, 1920, sired by a grandson of Majesty's Western King and out of a R. of M. daughter of Ibsen's Chief. For full pedigree and price write
E. E. HILL & SONS, Tomah, Wis.

Valley Farm is Offering
Several bulls, 6 to 12 months old, from R. M. cows. Sired by Golden Maid's Viscount and Kilda's Royal Majesty, two of the best Island bred bulls living. At prices to sell. Write
FRED STUBLEY, Black Earth, Wis.

JERSEYS—DUROCS
Just one bull old enough for service and a few young calves. Hood Farm breeding.
F. R. Constance & Sons, Waupaca, Wis.

Hillcrest Jerseys
Bull calf born March, 1920. Sired by Imp. grandson of Golden Fern's Noble. Priced right for quick sale. Write
ROLLIE VANDERVORT, TOMAH, WIS.

Six Splendid Jersey Bulls
FOR SALE. Good type, well bred and well grown, 12 to 18 mos. old, from dams in R. of M. or on test. Rich in the blood of H. F. Torono, Figgis, H. F. Pogis 9th, Pedro, Loretta D, King Sappho King and Golden Maid's Prince.
J. Q. EMERY & SON. - Edgerton, Wisconsin

Register Merit Jersey Herd
At Head, Mona's Jacoba Premier grandson: Pogis 99th of Hood Farm. Dam, Mona's Jacoba, record 806 lbs. butter: Granddaughter Jacoba Irene, young stock; St. Lambert breeding for sale. R. C. Green & Son, Albion, Wis.

For Better Jerseys
We do not retain in our herd any cow which under favorable conditions will not produce 500 lbs. of butterfat (600 lbs. butter) in 1 yr. on official test.
We have a few young bulls for sale.
THORNBURY FARM
LIBERTYVILLE, ILLINOIS
W. A. BREWERTON, Owner L. A. BENT, Mgr.

MILK 10509 Lbs. FAT 586 Lbs.
Average of 175 R. of M. records made by Ayredale cows. Forty R. of M. records made in 1920 by 16 two-year-olds, 4 three-year-olds, 1 four-year-old and 19 mature cows average 10,596 lbs. milk, 586 lbs. fat. With 16 two-year-olds bred at Ayredale in the 1920 lot, they equal previous records made largely by mature cows.
This 1920 performance is pleasing, because it proves our herd sires are breeding on and up.
Bulls and bull calves from above cows for sale. They insure big cows that are big profitable producers. To save correspondence, I would appreciate an inquiry from you giving age, color and priced bull you wish to purchase.
AYREDALE STOCK FARM
F. W. Ayer, Bangor, Maine

BELSWOOD FARM

Montpelier Manor Farms, Laurel, Md.

POLLED JERSEYS
Breeders' names and Spillman's "Inheritance of the Poll Character in Cattle" mailed free.
CHAS. S. HATFIELD, Secy, R4, Box 5, Springfield, Ohio.

CLOVERDALE
Jersey Bulls For Sale
$125—Age 13 mo.—$125
No. 1. 829.6 lbs. butter average R. O. M. record for 2 grandams. Two grandsires of 2 nearest sires premium winners National Dairy Shows.
No. 2. Sire out of cow with 865 lbs. butter R. O. M. record. Grandson Noble of Oaklands. Dam's 2-year-old R. O. M. record 446 lbs. butter. Her sire's dam R. O. M. record 886 lbs. butter. Others $75.00 up.
E. O. ANDERSON, Shelby, Michigan

Messrs. Ayer & McKinney announce the purchase of the breeding and importing business of Mr. Edmond Butler, Mt. Kisco, New York.

Through this transaction, all Mr. Butler's Jersey interests pass into the hands of Ayer & McKinney.

From this date the business will be handled from Meridale Farms, Meredith, New York.

The next annual sale will be held at Meredith, on June 2, 1921—the day following the annual meeting of the American Jersey Cattle Club.

Visitors always welcome at the Oconto County home of Jerseys.

JERSEY CREST FARMS, OCONTO, FALLS, WIS.

We are offering an interest in our business by selling young Bulls sired by Sayda Rose's Jap, No. 166586, out of young cows now on Register of Merit test who will finish in AAA Class.

Jap-Sayda Blood Predominates

We are reasonable in our offerings. Herd tuberculosis free, under Federal supervision. Health—Beauty and Economic Production our watchword!
We are now able to supply breeders who have written us previously regarding Jap-Sayda calves, if interested.

Vermont Buttermakers Compete

Forty Vermont buttermakers entered the contest staged at the meeting of Vermont Dairymen's Association the middle of January. C. M. Story won the first prize with a score of 97.5.

Many of the competitors were former winners of prizes. All entries were good and scored high, competition was close. Mr. Story takes the first prize to a creamery that has never won before, and Mr. Story is relatively new in the buttermaking business.

The Dairymen's Association met in connection with the maple sugar makers. The different state cattle associations met at the same time. Some of the speakers were Commissioner E. S. Brigham, Professor A. A. Borland of Pennsylvania State College, Dean J. L. Hills, E. C. Collingswood of New York, and F. H. Abbott of the Eastern Farmers' Exchange.

The dairymen's banquet was the last big event of the convention. There was a strong program of speakers and entertainers. The toastmaster was Congressman Frank L. Greene. Other speakers were Governor James Harkness, President Guy Bailey of University of Vermont, and O. E. Bradfute of Ohio, who represented the Farm Bureau Federation.

Pennsylvania. E. A. KIRKPATRICK.

The Alabama Farm Bureau Federation has completed a temporary organization and voted to affiliate with the national organization. With Alabama in, there remain but two states of the Union not affiliated.

BROWN SWISS

BETTY OF LAKE VIEW

Breed Brown Swiss Cattle

As producers they are worth every cent you pay for them. Cows are easily sold at reasonable prices. Their earning power has not been capitalized. Brown Swiss meet the ideals of working farmers.

Economy in Production ← GUERNSEYS → Quality of Products

The possibilities of the Guernsey are indicated by a cow purchased on the Island of Guernsey in 1914. The purchase price was $378 and the cost of shipping her to her American home was about $200. In 1920 this cow and three of her descendants were sold for $22,700. Every Guernsey cow can increase bank deposits if given a fair chance. Send for our free literature.

JAMISON BROS., Appleton, Wis.

The Price of This Bull Calf

is based upon his worth to you

ANTON'S PASHA OF PROSPECT 61884
Dropped October 31, 1919

SIRE—Anton's King Confidence 43517.
Traces 6 times to May Rose 2nd. His dam made 764.65 lbs. fat as junior 4-year-old. He is sired by Anton's May King, whose dam has a record of 766 lbs. of fat. Besides all of this he is the best individual that ever stood at the head of the Hoard's Dairyman Herd.

DAM—Buttermaker of Prospect 68769.
A young heifer of great promise. She is of good size and length. Both her sire and dam contain much of the blood of Starlight's Excelsior 7992. She recently completed a record as a junior three-year-old of 364 lbs. During her test she was milked but twice a day and received the regular herd ration.

As an individual Anton's Pasha is hard to beat. He is exceptionally well developed and has improved greatly since August when the above picture was taken.

Write or wire us if you want him.

Maple Heights Guernsey Farm

Frank E. Swan, Wauwatosa, Wis.

Federal Accredited Herd.

Responsibility of the Buyer

HOARD'S DAIRYMAN:—A great deal has been said, and is being said, about the responsibility of the seller in live stock transactions. This arises from the fact that a great many farmers every year buy their first pure-bred animal; they engage in the enterprise with high hopes, convinced that pure-bred live stock spells the way to speedy success.

We do not hear a great deal any more about the old style horse trader who operated in an unwritten code which meant let the buyer beware. Unfortunately, however, the rise of trading in other classes of live stock has infested the farming business with a new type of trader; those men who deal primarily in pedigreed live stock.

Nobody denies that we have dishonest salesmen of live stock, though their number is no doubt grossly exaggerated. A very little fire can sometimes cause a great deal of smoke. It is the writer's opinion that the live stock industry as a whole is sound, and that inexperienced men are overly fearful of deception.

Those farmers, breeders, and dealers who have been long in the business, and who have sold many animals, are able to tell a story which shows that there are two sides to every question. Again and again when buyers have asked for adjustments on animals bought, investigation has revealed that the buyers were trying to "slip something over" on the seller.

The two most frequent cases in which buyers try to deceive the seller are those dealing with tuberculosis and abortion. A buyer has been known to place a cow just purchased in his own herd, and when she reacted later, blame the seller and sue him not only for the value of the cow but also for the value of the herd, which he alleges was infected by the new coming cow. When the facts are sifted it is discovered that the buyer tried to shift the burden of a situation from his shoulders to those of the most convenient bystander. And it is the same way with abortion. Breeders will not readily admit that they have abortion in their herds. When they buy a cow which later aborts they declare their own herd was free.

Breeders who deal in large numbers of bulls also claim that many sellers fraudulently claim sterility. I remember one case in which a man returned a bull, claiming him to be a nonbreeder. The seller had considered his customer an honorable man and had not investigated. It developed later that the buyer had registered a great many calves as sired by that bull; and, sure enough, the bull proved to be a good breeder when returned to the seller.

The honest buyer of course recognizes that not all sellers are honest. But, being honest himself, he will give the seller a square deal by first establishing the status of his own herd. Before he introduces any new blood into his own herd he should make sure that the herd is tested for tuberculosis. His veterinarian, in case of trouble later, can then testify that the herd was clean or not clean, as the case may be. Abortion cannot be checked up as closely, but any dairyman can tell whether abortion is in virulent form in his herd.

In the case of bulls of breeding age, the buyer owes it to the seller to feed and care for a bull properly, and not to use him excessively. Many bulls have been ruined by new owners through crass carelessness and neglect. The seller should not be held responsible.

Wisconsin. W. A. FREEHOFF.

THE SECRETARY, 406 MARKET BANK BUILDING, MINNEAPOLIS, MINN.

This Splendid Son of Sir P. O. M. 41st

For Sale—Ready For Service

Born January 22, 1920

He is an outstanding individual, straight as a line and of unusual quality

HIS SIRE

Sir Pietertje Ormsby Mercedes 41st is destined to become one of the world's greatest sires. His sire is known as "The World's Greatest Sire of Show Ring Winners and Yearly Producers." His dam is the only 1,000-lb. cow in the world having three daughters above 1,000 lbs. or six averaging 995 lbs. No sire in the world equals him in point of proven transmitting ability in both sire and dam—and "41st" is proving it by handing it down to his offspring. The greatest show cow out this past year was one of his daughters. His first daughter to complete a yearly record is finishing with over 1,100 lbs. as a junior four-year-old.

HIS DAM

Edenvale Bessie Homestead, a grand individual with a record of 28.75 lbs. butter and 622.3 lbs. milk. Her dam is a three-fourths sister to Jessie Fobes Bessie Homestead, former world's champion 4-year-old with 34.96 lbs. in 7 days. Her sire is by the noted show bull, Sir Beets Cornucopia Netherland and from a 29-lb. cow. Mooie Mutual De Kol, Homestead Junior De Kol and De Kol 2d's Paul De Kol No. 2—all close up in the pedigree.

Send for pedigree and further information

First—Build on Paper

The man who builds cheaply is he who plans well before building. What a barn costs depends in no small degree on the care with which it is planned on paper in advance.

Mistakes made on paper are easily righted without expense and buildings on paper are readily moved.

Get your plans down on paper. Take plenty of time to study carefully; discuss it with others. Make it the ideal barn for your particular purposes.

Be sure you have the right amount of storage, enough light, air space and ventilation; work-saving arrangement for feeding, watering the stock and cleaning the stable; easy handling of the hay; and right location of the barn for sunshine and cold winds.

Make certain that the barn is correctly proportioned, is individual in appearance, a barn that is strong enough to withstand all storms—one that will add value to your farm.

Jamesway Barn Plan Service

You can have all this without extra cost.

The man who has plans completely worked out and blue printed, can submit them to several contractors, accepting in safety the lowest bid because all are bidding on exactly the same proposition.

Contractors and those supplying materials are held to exact requirements; substitution of inferior materials or workmanship is prevented; wastes and expensive "extras" are avoided; misunderstandings are unlikely.

In the Jamesway organization are scores of Barn Planning Experts, whose experience and help are yours for the asking.

For years, these men have studied dairy barns—construction, lighting, ventilation, drainage, arrangement to save labor; how best to remodel old barns. Every year they visit thousands of dairy barns in every section of the country; every year they help to plan thousands of barns.

The best of their ideas are in a 320-page book on barn building, remodeling, ventilation and equipment; this book will be sent free on request.

Write us now. Tell whether you expect to build or remodel this year; and say what barn problems are bothering you. Perhaps we can help you solve them. If you want the book, ask for "THE JAMESWAY BOOK No. 23."

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Fort Atkinson, Wisconsin Volume LXI, No. 7 March 4, 1921

Dairying is most profitable

PRICES for dairy products have held firmly, while the cost of feed has been greatly reduced. Because of this there is relatively more profit than ever in dairying, and many farmers are turning low-priced feed into high-priced butter-fat. An eminent dairy authority says that you can make corn worth $2 to $3 a bushel by feeding it to good cows.

Times like these prove the value of dairying. It is the backbone of the nation's agriculture — the most profitable, surest and safest of all branches of farming. Dairying is not suffering from overproduction, is not overcrowded or overdone.

And De Laval Cream Separators have done more than any other factor to place the dairy industry on such a firm and profitable basis. They save cream, time and money twice a day, every day in the year. They produce a steady cash income. They have made the market accessible, even though you live 500 miles from a creamery. They keep the skim-milk on the farm to produce another crop of calves, hogs and poultry. They are made so well that 20 to 30 years' service from a De Laval is not unusual. Over 2,500,000 are in use in all parts of the world.

You need a De Laval more than ever. There is a De Laval agent near you—see him.

The De Laval Separator Company

Sooner or later you will use a De Laval Cream Separator or Milker

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXI — FORT ATKINSON, WIS., MARCH 4, 1921 — Number 7

Factors Limiting Profits in Dairying

I. J. MATHEWS, INDIANA

PROFITS on the dairy farm are largely dependent on five factors: size of business, amount of live stock, milk receipts per cow, crop acres tended by each man and horse, and the crop yields. These factors are forcibly brought out by figures collected by L. R. Roberston and covering 27 farms in Indiana where cows furnished the principal source of income. These farms are not specialized dairy farms but are comparable with the ordinary farm whose chief source of income is from milk cows, but which supports other animals, as well as growing some crops for cash sales. These figures apply to all parts of the country and on farms under similar conditions, regardless of their location. Only by such an analysis of his business can each dairyman tell where to improve his income; it gives him the clue to the weakness of his methods.

Before presenting these figures, it is well to make it clear just what is meant by "labor income", since all the net results are given in terms of labor income of the operator. Suppose all receipts from a given farm are $3,936 and that the expenses for everything bought including hired labor, etc., are $1,277. Subtracting the farm expenses from the farm receipts would give $2,657 as farm income. Now subtract from this the interest on the capital invested, say, $671, and we have $1,958 as labor income. These figures apply to the 27 farms whose records were obtained in Robertson's survey and represent the average farm receipts, farm expenses, interest on capital, and labor income.

Records kept on dairy farms the country over show that about 55 per cent of the cost of milk production is for feed while twenty per cent is for labor. Feed and labor together register about three-quarters of the entire expense. It is therefore obvious that any feed saving or labor economies are directly reflected in the income of the owner. These 27 farms ranged in size from 52 to 380 acres and averaged 12 dairy cows to the farm. The labor income of the owners had a wide variation, running from $130 in one case to $7,620 in another.

Big Business Most Economical

Generally speaking, the larger the farms, the greater the labor income of the operator. Many things account for this. With the larger farms, it is possible to use the larger types of machinery and it is possible to use the same machine over a larger number of acres. Generally, also, the larger the farm, the less money must be invested in buildings for each acre of land in the farm. Some of these 27 men found it profitable to increase their business by pasturing some of their stock on rented pasture. The following table giving figures from this survey illustrates the larger income on big farms:

Acres in farm	No. farms	Labor income
58-175; average 127	16	$1720
176-320; average 221	11	2377

Heavily Stocked Farms Most Profitable

The relation of the amount of live stock kept on the farm to the labor income of the owner is shown by the following table. In this table mention is made of animal units and figures are given with animal units kept on each ten acres of land on the farm. What is an animal unit? Manifestly, it is impossible to add cows, pigs, and poultry and so these must be reduced to some equivalent and, since we are talking about cows, let's reduce the animals to cow units or that number of each that will eat about as much feed and produce about as much manure as one cow. For practical purposes, two calves or colts would equal one cow in this respect; similarly, 5 mature hogs, 10 pigs, 7 sheep, 14 lambs, or 100 chickens would be an animal unit. With these figures, the stock kept on each farm was reduced to terms of animal units per ten acres of land:

Animal units per 10 acres	No. farms	Labor income
Less than 1.5; average 1.07	11	$1340
1.5-1.75; average 1.62	8	1891
1.76-254; average 2.1	8	2987

The result of more stock in making more dollars jingle in the pocket of the operator is here vividly brought out. The larger the number of stock, the less the overhead expense per animal unit. Then, too, more stock makes it possible to keep the help employed more evenly during the year. This is a great factor as help kept the year around is much less expensive per hour of work done than that employed only during the rush seasons.

Good Cows Enhance Labor Income

The milk receipts per cow are a mighty factor in swelling the labor income of the dairy farmer as is witnessed by the results given below:

Milk receipts per cow	No. farms	Labor income
Less than $73	15	$1452
$73-$109	7	1543
$110-$201	5	4200

The relatively large number of farms whose receipts per cow were less than $73 each shows that this was one of the weakest points encountered in the survey. It means that many dairymen are not getting satisfactory returns because they are spending good time and good feed on unproductive, hence unprofitable, cows. Good quality cows not only gave more milk but their calves sold for more money than the calves from mediocre producers.

Efficient Labor Helps Income

Some men working in small or odd shaped fields did not take care of very many crop acres; other men working in larger fields or with more horses and larger machinery took care of larger fields or with more horses many more crop acres. These differences as set out below show how dependent the labor income of the owner is upon the crop acres cared for by each man employed:

Crop acres per man	No. farms	Labor income
Less than 40; average 33.5	8	$1502
40-100; average 66.1	19	2129

The differing efficiencies of horses used on these farms was about as variable as that of the men. The average horse on the average farm took care of 16 acres. On some farms, each horse cared for but 13 acres while on adjoining farms thirty crop acres was the lot tilled by each horse.

Crop yields affect labor incomes but not to the extent that might be thought. Small crop yields make serious inroads into the labor income but where dairy cattle are kept year after year the crop yields are usually high and, when the dairyman finds himself with a small labor income, he can usually strengthen it most by increasing the efficiency of men and horse labor, the size of business, or the quality of cows. Competing crops must be eliminated and some other kinds of stock such as hogs or chickens are quite necessary. The figures given here furnish a standard by which dairymen can compare their businesses with those given. Is the business large enough? Is there enough live stock on the farm to consume all roughages and give even labor distribution? Is horse and man labor giving maximum service? Could some fields be enlarged so as to give longer bouts? Here is food for thought.

HANDY TRUCK ON FARM OF PERRY VYNGAR, WISCONSIN,—A CONVENIENT MEANS FOR QUICK, SAFE TRANSPORTATION OF DAIRY ANIMALS

Can Home Grown Rations Maintain Milk Production?

GEO. C. HUMPHREY, Wisconsin College of Agriculture

IN the minds of many farmers and in their practice of feeding dairy cattle, "home grown rations" appear to be sufficient for securing profitable milk production. Such farmers do not expect a large flow of milk, except in the case of comparatively fresh cows on fresh green pasture, which, where supplied in abundance, is one of the most complete rations that can be named. It is the opinion of another class of farmers that in order to secure most profitable returns from dairy cows, and throughout the greater part of the year, a ration should include a considerable amount of purchased feeds, more especially concentrates rich in protein. This class of men recognize that the average farm grown ration used in the middle and north central states is deficient in the amount of protein required by dairy cows capable of making relatively high productions of milk. For this reason it is their opinion that home grown feeds must be supplemented with such concentrates as oil meal, cottonseed meal, gluten feed, or other feeds bearing a high per cent of this compound.

For some time past it has been recognized that the amount of protein in a ration is one of the limiting factors in securing a given amount of milk from a cow, or growth in young animals; and, naturally, therefore, a considerable study has been made by experiment station workers regarding the value of protein mixtures for growth or milk production. As a result of this work, it has been learned that the quality as well as the quantity of protein and furthermore, that the manner in which the protein of one feed combines with the protein of another feed, has much to do in determining the value of a given ration in meeting all of the requirements for most satisfactory results. The newer knowledge gained teaches us that the time is past for set nutritive ratios or balanced rations that are based simply on the amount of protein, regardless of its quality, if most economical results are to be secured.

A new field for investigational work has therefore been established; for it is only by a long series of investigations that we shall be able to learn all of the facts relating to what feeds will combine to the best advantage to give most efficient results. The practical feeder will observe and learn many of these facts from his personal experience and, in fact, he has already gained a knowledge of many rations that are highly efficient. A protein supply that will keep a cow in what is called "nitrogen equilibrium", or, in other words, that meets all the requirements for body maintenance and at the same time enables the cow to make the amount of milk she is capable of producing, is all that is necessary.

Rations of Clover or Alfalfa Hay, Silage and Cereal Grains

Dairymen have been taught the superior value of clover and alfalfa hay because of their relatively high protein content, and in many instances have been led to believe that with these hays it is comparatively easy to provide a ration from farm grown feeds that will answer all needs. To judge the efficiency of a dairy ration, the measure of a cow's capacity to produce milk must be taken into consideration and furthermore the influence the ration will have on her body as regards maintenance. A ration that is incomplete or insufficient will result in one of two things in a very short time; namely, a reduced milk flow, or an improper maintenance of the body. Only in the case of cows of strong milking tendencies and with reserve of body tissue will milk production keep up for any period of time at the expense of the body tissues. Nutrients supplied from the ration must be the chief source of the milk that any cow produces. Sooner or later in any event, where the ration is insufficient, there will be a reduction in the milk flow to a point where the ration can: first, meet the requirements for maintenance; and, secondarily, produce a given amount of milk.

At the Wisconsin Agricultural Experiment Station studies are being made by the Agricultural Chemistry and Animal Husbandry Departments to learn the results of making combinations of feed that meet the requirements of cows under the newer knowledge regarding protein mixtures. Two trials have been made: one with clover hay, corn silage, and cereal grains; and another with a similar ration excepting that alfalfa hay was substituted for the clover hay. These trials have been published in Volumes XXXVIII and XLIV of the Journal of Biological Chemistry and are briefly reviewed herewith to answer numerous inquiries concerning them. Regular bulletins will undoubtedly be published after results that will further verify those thus far reported have been secured.

The Ration with Clover Hay

The original plan for feeding this ration was to carry three cows through a period of sixteen weeks, divided into four periods of four weeks each. The ration was to consist of medium red clover hay and corn silage, to which was added ground oats in the first period of four weeks; ground barley in the second period of four weeks; ground corn in the third period of four weeks; and a mixture of the three grains in the fourth period of four weeks. To correct any lack of energy supply in the different rations, a small amount of corn starch was added to each. The plan as outlined was carried out for the first two periods, when it was necessary to substitute two new cows, for the reason that before the end of these two periods the production of milk had gradualllly decreased to a point where it was necessary to have at least two better producing cows to note further results of such rations on maintaining fairly high milk production.

The system of feeding three of the cows conformed to the common practice of feeding 1 pound of grain to 3 pounds of milk, while two of the cows received a larger proportion of grain to stimulate a greater production if possible. Silage was fed in amounts varying from about 23 to 29 pounds, and hay in amounts from 7 to 10 pounds. Two of the cows used were pure-bred Guernseys, one a grade Jersey and two pure-bred Holsteins. They were fed and milked twice daily, had free access to water, and received every attention to secure favorable results. The excreta was quantitatively collected and analyzed and the milk weighed daily. A seven-day's composite sample of the milk was secured and tested for butterfat.

Production Records

Cows 1, 3, 4, and 5 used in the trial started with productions of milk ranging from 31.3 pounds to 37 pounds daily. Cow No. 2 began the trial with a production of about 24 pounds of milk daily and ended the period of sixteen weeks without decreasing her average daily flow of milk more than 3 pounds. In the case of the higher producing cows, the production of milk within a month's time decreased to approximately that of cow No. 2. These cows upon being put into the trial, immediately went

A Co-operative Creamery in Idaho

PHILIP T. FORTNER, IDAHO

DAIRY cows, alfalfa, fruit, and a program of co-operation are making Payette County, Idaho, a richer county each year. A few years ago fruit including apples, cherries, and prunes immediately came to mind upon mention of Payette County. Now while fruit growing is still a stable and profitable industry, making Payette County one of the leading fruit districts in the state, the dairy cow has also come to the front bringing a profitable diversity to farming operations.

The development of the dairy industry in Payette County really begins with the organization of the Farmers' Creamery in 1915. The farms in the county then as now were small, as are the individual holdings in nearly all fruit districts. Some years profitable results were secured from the fruit crop, but in many years the reverse was the case, thus making an unsatisfactory condition. A few cows of rather ordinary type had been brought into the county by some of the farmers to afford a steady income. Marketing conditions were bad, however, and leading farmers recognized that if dairying were to increase, existing conditions must be remedied. The result was the organization of the Farmers' Co-operative Creamery Company which has from that time on been a remarkably successful example of a farmers' marketing organization and brought about a large increase in the number of cows owned in the county.

Here is the record of business for the four complete years for which statements are available.

Year	Lbs. of butter	Gals. of ice cream
1916	200,440	2,122
1917	264,409	5,192
1918	428,718	10,528
1919	611,000	17,267

Because of the efficient management of the creamery, prices several cents above any other market have been paid throughout that time. This margin was five cents a pound for the past three years and last year $35,000 was paid local farmers above what they could have received from any other source. Since the organization of the Payette creamery five co-operative creameries and cheese factories in Southwestern Idaho have failed. The success attained in Payette is credited to the businesslike management of J. R. Brown, a graduate of the Oregon Agricultural College, who has served the organization as manager since its incorporation.

MODERN PLANT OF FARMERS' CO-OPERATIVE CREAMERY CO. AT PAYETTE, IDAHO

When the creamery started in 1915, Mr. Brown was the only employee and business was started in a small shed in the edge of the town. The product of 300 cows was the entire volume of business. In 1919 there were fifteen employees and 1,170 patrons owning approximately 4,000 cows and manufacturing was done in a new modern creamery building costing $17,000 which had been entirely paid for in addition to $13,000 worth of other real property owned by the company surrounding the creamery site.

In addition to paying prices well above the market for butterfat, a patronage dividend totaling $5,000 was turned back to patrons at the rate of one cent per pound of butterfat supplied in 1919. All employees of the creamery also received a bonus equal to ten per cent of their year's salary and final payments were made on the property of the creamery.

There are now 198 stockholders in the Farmers' Creamery and all of the stock is subscribed. Stock bears ten per cent interest.

The creamery manufactures butter under the name "Sunshine Brand" which is sold in carload lots being shipped to New York and Chicago as well as the Pacific Coast markets. An excellent quality of butter is produced and Manager Brown invariably

SAND SOIL SALVATION

L. F. GRABER, Wisconsin College of Agriculture

HAROLD G. FROST
A heavy weight in brains on a light weight soil.

TO one who is accustomed to view the rich limestone soil areas of southern Wisconsin, it is quite a revelation to go up into the sand country and see alfalfa growing where rye, potatoes, sand burs, and possibly six per cent interest grew mostly before.

But this is just exactly what one will find in the vicinity of the little sand swept village of Almond, Wis., where there are now a few pioneers in the business of sandy soil salvation. Not among the least of these is Harold G. Frost.

Equipped with an agricultural college education, a reasonable amount of funds, unusual enthusiasm and pep, good judgment, and a love for outdoor labor and outdoor life, he married and settled down on his father's farm of some two hundred forty acres, to win his way in the wiles of sand land culture.

That was seven years ago. For the most part his dream has come true, for he has redeemed that soil, built it up, renovated it, put "pep" into it, rejuvenated it, and all the while these improvements have more than paid for themselves—and that is saying a lot.

Sandy soil salvation sounds sentimental, but it takes a sort of missionary zeal to really put it across. Harold G. Frost has that kind of enthusiasm.

"I'll tell you there is no soil in all the world," he often repeated to me as we went from field to field "that you can tear down as quickly, that you can run out, impoverish, and ruin almost beyond the point of redemption as rapidly as you can a sandy soil. There is just one big factor that offsets all this foreboding, and that is where my hope and trust, and where I believe the hope and trust of the sand country, lies. There is no soil in general that responds so well, that reacts so readily to good treatment as this very sand land. The big problem is to what extent can we expend our hard earned money for soil improvements so that the increased returns will pay for their cost plus reasonable profit. There is a head scratching proposition that has always puzzled me. This economic aspect of sandy soil improvement and sandy soil farming is the crux of the whole situation. I know I made a big mistake when I started out seven years ago."

Lime! Lime! Lime!

"If I had not been quite so timid and conservative when I began to run this farm—if I had had greater dollars and cents confidence in the soil facts that I became acquainted with in college, I believe today I would be debating whether I should spend the winter in Florida or California. I mean this. I had no idea—at least no full comprehension — of what benefit lime—ground limestone—would be for this sand country, consequently my first use of limestone was in an experimental way and on a rather small scale. To one field I applied about three tons per acre seven years ago. We ran out of limestone on the north end of the field. It was planted to corn and later grain. The lime seemed to help, but no result showed up which made me very enthusiastic until the year we seeded this field down to alfalfa. Well, sir, I am not going to tell you about it—I'd rather show you. I want to let this lime talk for itself."

With this he took me over one of his eight-acre patches of alfalfa, as good as anyone would wish to see. But when we came to the north edge of the field the soil was bare as a board. There was nothing there except a few scattered weeds. The edge of the good alfalfa looked like a map of the coast of Maine.

"That irregular boundary of the alfalfa is where we threw out the last shovels and you can see where everyone lit. This experience and one or two others here has led me to buy during the past year seven carloads of lime and six of these have arrived and have been unloaded and distributed. We put on about three tons per acre with a lime distributor having a double agitator and it works fine. We plan to put this lime on the top of the plowed soil and work it in as we prepare the seed bed.

"Lime, lime, lime is the first step in the salvation of this sand land. It doesn't make any difference whether it's alfalfa or clover, it takes lime to make it grow. Why, I'd just as soon feed clover seed to chicks as to sow it on our soil without using lime. I say this from bitter experience. I've wasted lots of money, time, labor, and energy because I failed to appreciate early in the game that these soils are too destitute of lime for such lime hungry crops as alfalfa and clover, that we absolutely have to have to keep up our fertility."

NO LIME, NO ALFALFA AS ILLUSRATED BY ONE OF FROST'S FIELDS

Alfalfa Better Than Clover

"Speaking of alfalfa and clover as hay crops, which do you prefer?" I interjected. 'Both," he replied, "but, five years ago I would not have favored alfalfa. However, I've learned more out of college than I did in college, which is not meant as a reflection on agricultural education—far from it—but I now put alfalfa ahead of clover. Not that I love clover the less, but that I love alfalfa more. And here are my reasons. First of all, alfalfa lasts longer, it stands the winters better, especially if you use hardy but hard-to-get genuine Grimm, Baltic, or Cossack seed. Alfalfa is more drought-resistant than clover, particularly in its first year's growth, and we need drought-proof hay caps on soils that dry out as readily as these."

"But," I asked, "is it not true that red or mammoth clover is easier to grow than alfalfa?" "Yes and no" was the rejoinder. "On poor sandy soil I guess clover is safer but on any reasonably fertile sand, alfalfa is as sure if not the surer. They are both good crops but my faith is pinned to alfalfa."

In growing alfalfa Mr. Frost is most careful about the methods of seeding. First, last, and always, the soil conditions must be made right. "Lime, inoculation, and manure make alfalfa doubly sure" is his motto. The soil is generally fall plowed and then harrowed and rolled in the spring with a corrugated roller to bring about the desired firmness of the seed bed. The alfalfa seed is inoculated just prior to seeding with a bacterial culture which he secures through his experiment station. The seed is sown at the rate of from fifteen to twenty pounds per acre, early in May. Sometimes a light nurse crop of about three pecks of oats is used, but to save the alfalfa from summer drought it is invariably cut the latter part of June or the first part of July for hay. "If you use a nurse crop with alfalfa on sandy soil get it off early," is Mr. Frost's flat assertion.

"I like the alfalfa-timothy mixture suggestion, and have used fifteen pounds of alfalfa seed and five pounds of timothy seed per acre in all my new seedings. The timothy helps to keep out the weeds where the alfalfa may be a little thin."

"What nurse crop do you prefer?" I queried. "Kherson oats," was the prompt reply. "It heads out early and makes fine hay. By the way, that's a wonderful oats for good sand land. It ripens up fast and escapes the damage of the hot, dry winds, rust infections, and grasshoppers that generally make their appearance about the middle or latter part of July. Swedish Select has always been the standard oats around here, but this year our Kherson outyielded it by nine bushels an acre. On rather poor sand Swedish Select is better. The Kherson is too short stemmed for any soil without a fair degree of fertility."

NO CROP IS MORE IDEALLY ADAPTED TO SANDY SOIL THAN THE SOY BEAN

Fertilizers to Fight Drought

From the alfalfa we journeyed to a cornfield of some twenty acres, most of which had been cut to fill a good sized silo. It was the cleanest field I had ever seen. Hardly a weed could be found. "How do you keep your corn so clean?" I asked. "Oh, that's easy," he replied. "You know sandy land has many virtues that the heavy soil farmer never learns to appreciate. First of all it is seldom ever too dry or too wet to work or plow our fields. We are not troubled with clods or lumps. The ground mellows down in spendid shape. In the spring our soil warms up quickly, and with plenty of rain and a reasonable degree of fertility, crops grow with almost lightning rapidity. The soil cultivates so readily it is an easy matter to get rid of the weeds, and rain seldom keeps us out of the fields for any great length of time. Of course we are seriously affected by prolonged summer drought. That's where the heavy soil fellows have a big advantage on us, but we can overcome this in a measure by the proper use of manure and fertilizers and by surface cultivation. This may seem strange but let me explain. If we have plenty of available fertility in this soil our early ripening crops, such as grain and hay, will generally make their full growth and development before the dry spell comes. With late crops like corn and potatoes this holds true to a less degree. I am a firm believer in commercial fertilizers in addition to manure. I generally use from 100 to 150 lbs. of a 2-12-2 fertilizer drilled with a fertilizer attachment in my corn at corn planting time. It certainly gives the corn a quick start and I believe it pays the biggest kind."

Fighting Sand Pests with Fertility

It is the writer's observation that grasshoppers thrive best, multiply with the greatest rapidity, and do the most damage during dry weather. Without assuming the prerogatives of an entomologist, he has a belief

(Continued on page 286)

When To Buy A Milker

WALTER JACK, OHIO

NOW is time to give the purchase of a mechanical milker consideration. In early spring and summer herds will be in full flow of milk, and when the tendency of the herd is toward maximum production is the time to install a machine. Dairymen too often make the mistake of waiting until the rush of work of midsummer to purchase. It requires time for the operator to become familiar with a mechanical milker, and after the cow has passed her maximum flow, she will not as readily respond to mechanical milking.

It is the contention of the writer that the machine should be applied to the cow immediately after the calf is removed. If this is not practicable, in any event the machine should be ready for operation as soon as perhaps eight or ten cows have freshened and the calves are removed. Starting with a small number of cows, it is much easier for the owner to become familiar with the machine and the manipulation of the cow's udder during the milking process. As the number of fresh cows increases, the task of milking will become easier. I have observed that machines installed in midsummer have generally failed to give the satisfaction they should. Our machine was purchased in July. It was used on a dairy which freshened in the spring, and the service which it gave was less satisfactory than that of any one of the five other seasons in which we have made use of it. A small proportion of the cows responded at once, while even some of the number were not yielding well to the milker at the end of six weeks.

It is the observation of the writer, that the older the cow the more perverse she is in the matter of milking. We have had no trouble in accustoming a heifer to the milker, and they respond readily when the calf is taken from them. I have observed heifers swing their heads in the stanchions and quietly watch the unit in the process of milking. They seldom protest, and we have had no trouble with cows kicking as they do in hand milking. The young cow will respond better than the old cow at any season of the year, and the heavy producer will accustom herself more readily to the milker than the cow from which milk must be pumped by force of suction.

The dairyman must not conceive that the milker will do all the work, while he is seated behind the cows with arms folded. It is as essential for him to work with the machine, as for the typewriter operator to operate the machine. It is necessary to manipulate the udder as the milking advances, and in this way stripping may be reduced to a negligible quantity. However, in some herds there will be, regardless of the efficiency of the machine, cows that will at times fail to respond, perhaps in one or more than one quarter. Manipulation and the testing of these cows by stripping in the teat cup will determine which cow should be stripped. It is the writer's preference to strip the cows in a pail and keep the machine busy milking. With two double-units, one man can attend to changing machine, manipulating the udders, and stripping such cows as must be stripped in a pail. With three double units, a boy and man can handle this outfit very efficiently, and for best results two persons are required. The tendency at present is to install three double units, and it is the belief of the writer that such an installation will be of advantage in herds of 18 or more cows.

It will require some time for the operator to familiarize himself with a machine. The purchaser should not condemn a milker at the end of the first two or three milkings or even at the end of a week or month if it fails to work as well as he may expect, for after all it is first the man, then the cow, and last of all the machine, as Professor Larsen has stated. Most all machines seem to have been brought to a very high state of perfection and are giving very satisfactory service in herds, yet there are machines of all makes which are standing around milk houses unused. This condition is not in any way a condemnation of the machine. It may be due to the herd, to installing the machine late in the lactation period, to a bothersome power plant, or to lack of service on the part of the dealers. This service feature may have considerable to do with some plants falling into disuse.

It is the tendency of local distributors and salesmen to believe that the milker has been on the market sufficient time to become a fixed piece of farm equipment similar to a mower or harvester, and they remain with the dairyman one, two, or three milkings, and then allow him to shift for himself. Furthermore, their method of instructing the farmer may not be strictly pedagogical, as the writer observed in the case of the plant on a neighbor's farm which was ordered out, since the farmer was not given sufficient instruction and encouragement in the use of the machine. On the other hand, three men on this farm are familiar with thresher, tractor, automobile, and all other farm machinery, yet they were not satisfied with the mechanical milker, although the machine installed was one of the best.

It is a question in the writer's mind if all farmers should buy a milker as they do a mower, relying on their ability to get away with it, with limited service from the dealer. Some of the best machines are sold on "no trial" basis, while others as good are sold affording the farmer opportunity to try the machine. In the latter case, one might expect usually a greater effort to satisfy the purchaser and get him well started with the machine. On the other hand, if the farmer purchases a machine without trial he will stick to it until he does get results.

There is no question but that mechanical milking is the most efficient and sanitary method, and in all probability will prevail in all herds above eight cows. We could not and would not go back to hand milkng. In any event the dairyman should purchase his machine that he may get it working at the beginning of the lactation period. He should have it working early in the season when he will have time to give the work the attention that he should. He will find it tiresome "squatting" and he will be clumsy about the handling of the teat cup clusters, but in time this will become entirely natural. When his movements become mechanical then he will realize the high degree of efficiency he can obtain by use of the machine.

Dairy Echoes From Oregon

F. L. BALLARD, OREGON

THERE has been renewed interest this year in cow testing associations in Oregon. Four new associations have been organized and three which had been in operation were reorganized. The new associations brought the total number in the state to thirteen. Interest is strong for similar work in four or five other counties. It is of some significance that the only associations in the state are in counties employing agricultural agents. It seems that the service of the agents is really an essential in keeping the organization going from year to year. In the thirteen associations are 5,622 cows. During the past year more than 500 unprofitable animals were eliminated, it is said.

There are four associations in Coos County having 3,370 cows on test. Tillamook County, famous for its cheese manufactured and sold co-operatively, has two testing associations. One has 1,000 cows enrolled and employs two testers during a part of the season. In several counties where there is not yet sufficient interest for an association or where dairying is just developing and the cows too few in number, there are testing clubs carried on under the direction of the county agents. Milk is weighed regularly and samples are taken once a month and tested at the various high schools which have installed a Smith-Hughes system of agriculture, the work being done by the boys or by the Smith-Hughes teacher. The oldest testing association in the state is in Tillamook County and has been in continuous operation since 1912.

Fees per cow run from $1.50 a year to $3.00 and in several of the associations there is a minimum charge per member running from $20 to $36 per year. The highest fees are paid in Jackson County, a specialized fruit district, where dairying is not yet a major line of farming. The association in Jackson County has the highest fee per cow, $3.00, and as there are only 320 cows in the association, additional funds were provided by commercial organizations in the county whose directors realize the benefits to the future of the county from weeding out the poor producers.

A new Class F champion record of production for the Guernsey breed was recorded November 6, 1920, at the conclusion of a twelve months' test, by Katherine's Trixie, owned by Circle W Farm, Ohio. The milk production for the period was 18,945.7 lbs., a margin of 3,416.9 lbs. over the previous record, held by Langwater Hope. The butterfat record was 791.48 lbs. Katherine's Trixie was sired by Madge Chena's King of Anna Dean Farm. Her dam was the imported Trixie of the Isle. Katherine's Trixie was 2 years, 6 months, and 28 days old when she began her test.

Throughout the test Katherine's Trixie was milked four times a day. She was a very persistent milker, her closing day showing a production of 46.4 lbs. Her best day's milking was 61.9 lbs. Her maximum day's ration was 18 lbs. of grain. She completed her test weighing 1,350 lbs. She carried a calf for 185 days of the test period.

Ten county breeders' associations confined to the advancement of different dairy breeds were organized or reorganized in Oregon during 1920 and of these four were county Guernsey breeders' associations; eight were Holstein associations, while ten were organized to promote the interests of the Jerseys.

There are five counties bordering directly on the Pacific Ocean on the Oregon coast. Warm winter winds and cool summer breezes make this section bordering on the ocean an ideal dairy district. Four of the counties, Tillamook, Coos, Lincoln, and Clatsop, are already important dairy districts and rapidly developing. All are also engaged in a county-wide tuberculosis clean-up campaign. Six thousand cows have already been tested in Clatsop County where the work has been practically completed. There were 136 reactors. In Lincoln County 1,500 showed seven reactors. Equally low percentages are being found in the other counties. This work is proving very popular in Oregon and several other counties are planning on clean-up campaigns.

Fifty new silos were constructed by dairymen in Benton County in 1920. This increase is largely due to the increased acreage of corn in the county. Corn does excellently for ensilage purposes in the Willamette Valley, but the old fashioned one-crop farming system has hung on to a considerable degree in some counties. In 1915, there were only 500 acres of corn in Benton County, and the farmers who raised it were pleased with the results. The county farm bureau staged a corn show in 1918. The acreage of corn in the county increased to 2,656 acres in 1919. One Benton County dairyman says that a man with a silo and no cows is in the dairy business in a better way than the man who has the cows and no silo, while others state that they make

more money from one-half to two-thirds of feed now that they have a silo.

⚜

There is some discussion in the state regarding the enactment of a compulsory dairy bull replacement law by the coming legislature. Some believe this the most effective way to increase the quality of Oregon's dairy stock since, notwithstanding vigorous educational campaigns on the part of extension agencies, the Oregon Dairymen's Co-operative League, banks, and the breed associations, there are still large numbers of farmers who are inactive in herd improvement. It is planned to model such a law, if it is finally thought desirable, after the state stallion registration law. Some leaders are opposed to such laws on the grounds that they should not worry much about the man who is not sufficiently interested in his business to trade a scrub bull even up for a pure-bred one, as dairymen in Coos County have had opportunity to do this fall.

A large number of dairymen are taking advantage of that opportunity, however. In Coos County, three banks which combined last year to employ the county agricultural agent as their agricultural representative, are trading pure-bred bulls for scrubs on an even basis. The banks are sharing the immediate financial losses in this connection in the assurance of increased business when the dairy stock of the county is on a higher average production basis. After the trading had been in progress for several weeks, the banks assembled more than fifty scrub sires and paraded them through the streets of Marshfield to the freight yards where they were shipped out of the county to a Portland packing house.

⚜

The anti-oleo bill which was placed on the ballot in Oregon for the last regular election with the idea in view to establish an annual license fee of $500 for manufacturers and $250 for wholesalers and also an annual fee of $5.00 for hotels and restaurants which served oleomargarine, was voted down by the people of the state approximately two to one. Analysis of the vote showed a rather peculiar situation. The bill in general had strength in the dairy districts, Coos and Washington Counties voting in its favor. Tillamook County, one of the leading dairy counties, voted against it. Deschutes and Malheur Counties, alfalfa growing districts reclaimed from the desert by irrigation and surrounded by a large cattle territory, also voted in favor of it. This is thought to indicate that the alfalfa growers are looking with increased favor on the dairy business in place of growing alfalfa hay for sale only.

⚜

The market commission bill which sought to establish a state department of markets and had the backing of the Dairymen's Co-operative League, the Oregon Growers' Association, and many other farmers' organizations, was also voted down. This bill failed to carry in any county. Its failure is credited to the general tightening financial situation and a cry for decreased taxes together with a general lack of understanding of its importance.

Will Chicago Dairymen Win?

Bramhall Says They Will—If They Change Their Present Practices

In a late issue of the Breeder's Gazette, John T. Bramhall makes some very clear statements concerning the dairy situation in the whole milk districts about Chicago. He sets forth the conditions which are now found on these farms and shows that far less than satisfactory returns are being secured. He states that the dairymen of this section can win out if they will do certain things and then proceeds to list a number of those practices which are usually considered essential to profitable dairy farming but which, he stated, have not been in practice in the district of northern Illinois. To "win out" he advises those very practices which have been put before dairy farmers for thirty years by every agency which seeks to promote the good of dairy farming, but which they have almost universally failed to adopt. Excerpts from Mr. Bramhall's statements follow:

"The character of stock kept is really the crux of the situation. The pure-bred herd is in a small minority, and good grades, above the 5,000-pound mark, are not numerous. The cows are mongrels. Selling all his milk, the dairyman cannot afford, from the income standpoint, to raise calves, and it is only in exceptional cases that he does so. When the cows go dry he sells them off and buys fresh animals, and so the gamble goes on. The building up of herds of good blood or proved records is therefore impossible, and while it may be admitted that one 12-quart-a-day cow is much more profitable than two 6-quart-a-day cows, the 12-quart-a-day cow is only a dream to the average dairyman. Another disadvantage which is easy of correction is in the neglect of barn records. The dairyman keeps hotel for a dozen or twenty cows, and has no record of whether they are paying their board or not. He does not raise hogs, for he has no skimmilk, and thus is deprived of an important source of revenue. He keeps little or no poultry. So the milk dairyman is compelled, or so it appears, by the conditions of his business to be a one-crop farmer; a producer of milk, buying his meat and feeds, raising a minimum of crops, and compelling, by the necessities of the case, the consumer to make good his losses. In other words, he has got to get a higher price for his whole milk than his brother dairyman who sells cream and retains his skimmilk for his small stock. Whether it pays him, in the long run, is another story. At all events, the people of the city must have their milk, and they pay the price.

⚜

"Will the dairymen win? The dairymen will win, according to my lights, if they are wise; but they will surely lose if they are foolish. By that I mean that if they use wisdom in their methods, if they study the best systems of dairying, weed out their boarder cows, select their cows by record tests and pedigree, raise the promising heifers, build up their herds, use only pure-bred bulls, keep barn milking records, and figure on cost per cow rather than per quart, organize cow testing associations, diversify in their farming, and support and extend their co-operative organization; if, in short, they grow wiser, and learn how to produce the most, the best, and the cheapest, they will be in the way to win; otherwise not."

Milk furnishes vitamines; we can't grow without 'em.

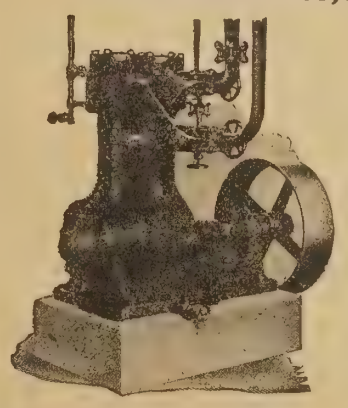
"Dandelion Butter Color" Is Big Prize Winner

Be sure and use Dandelion Brand Butter Color and give your butter that June golden shade which brings top prices —pleasing the eye and tempting the palate.

The High Scores of 1920

In many of the State Buttermakers' Shows, first awards were won by users of old reliable "Dandelion Brand." You can't miss by giving a trial to the butter color which helps 90% of the successful buttermakers of America.

Never gets rancid. Doesn't affect flavor,
Doesn't color the buttermilk. Leaves no sediment,
Colors more butter to the gallon.

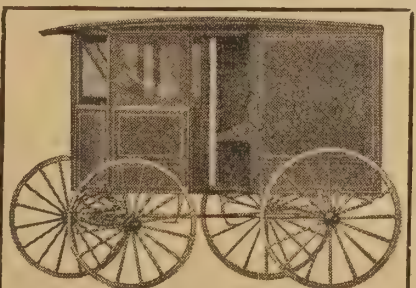


Dandelion Brand Butter Color is purely vegetable and fully meets requirements of all Food laws—State and National. Ask your jobber for prices.

WELLS & RICHARDSON CO., Inc. **BURLINGTON, VERMONT**

Sanitary, Economical, Durable

MECHANICAL REFRIGERATION



For Creameries, Milk and Storage Plants

Vertical Twin Cylinder Refrigerating Machine.

Modern methods demand better sanitation in creameries, milk and storage plants. The imperfect system of "ice cooling" will no longer answer. Aside from the troubles arising from ice cooling, after the first cost, mechanical refrigeration is more economical. The difference in the cost of operating an ice machine and that of ice to do the same work, will soon pay for the installing of a refrigerating plant. Every creameryman knows the importance of temperature control, not only in the cooling room, but in the cream ripening process. With mechanical refrigeration you have perfect control at all times.
HORIZONTAL machines in all sizes from 6 TONS to 750 TONS daily capacity. If interested write for bulletins.

THE VILTER MFG. COMPANY, 874 Clinton St., Milwaukee, Wis.

Strictly high grade milk wagons, built upon honor and fully guaranteed. Ask for free catalogue showing styles for every requirement. Suitable terms and liberal cash discounts. Pioneers in milk wagon building with sanitary bottled milk equipment. Also builders of metal panel wagons at low prices.

De Kalb Wagon Company,
P. O. Box E, De Kalb, Ill.

Kalamazoo
"The World's Standard"
TILE AND WOOD SILOS

CONSIDER the name. It means America's standard—positively superior in material and construction. It means Silo satisfaction for your lifetime and generations to come.

The Kalamazoo Silo is a permanent, profitable investment, and whether you choose wood or the more permanent tile, you are sure of extra value for your money. **It is one sure source of farm profits in 1921.**

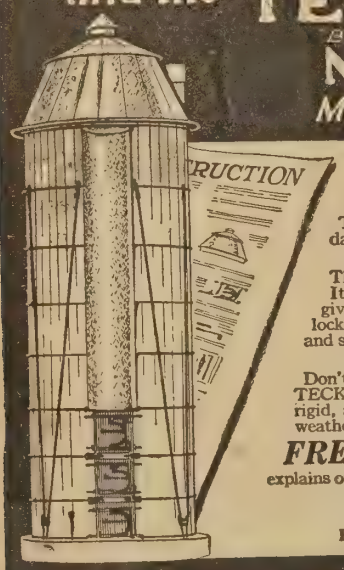
Glazed Tile Silos

Made of hollow tile blocks having three dead air spaces—as "permanent as the Pyramids." Substantial reinforcing, frost-proof, moisture-proof, acid-proof, storm-proof, vermin-proof, and will not burn. Continuous door-frame galvanized after assembling. Will not rust. Easy to erect and require no paint or repair expense.

Wood Stave Silos

Shipped complete ready to set up. Easy to erect—no nails or screws—choice of 4 well-seasoned time-defying woods—airtight joints deeply grooved, tongued and splined. Valuable exclusive features include continuous doors, steel door frame, galvanized after assembling.

Order Your Silo Now



Your Kalamazoo shipped now may be put up before the busy days. Don't wait—write today for our special proposition to early buyers. We will save you money.

Wood Silos Make Perfect Silage —and the TECKTONIUS METHOD Make Perfect Silos

BEST SILO ON EARTH

That's a fact! 7,000 TECKTONIUS silos in Wisconsin alone prove it. Thousands more in the United States, Canada and foreign countries. Before you decide on a silo investigate the TECKTONIUS METHOD of Silo Building, endorsed by dairymen and farmers everywhere.

A 5-Year Success

The TECKTONIUS METHOD is a proven success. It is backed by a 5-year guarantee. No other silo can give you the exclusive TECKTONIUS air-tight door that locks at four corners, automatic adjusting hoop fastener and super cable and base stave anchorage system.

Beware of Imitations

Don't confuse ordinary silos with superior silos built by the TECKTONIUS METHOD. Our method gives you a rigid, air-tight silo that will stand for years, in all kinds of weather—one that makes perfect silage right up to the wall.

FREE Farm owners, write today for our book "Perfect Silage". It gives you the real facts about silos and explains our method fully. Also send name of your lumber dealer.

Neutralized Butter Ruling

Wisconsin Dairy Interests Hold That Law Has Been Misinterpreted

HON. W. M. WILLIAMS,
COMMISSIONER OF INTERNAL REVENUE,
WASHINGTON, D. C.

DEAR SIR:—We beg leave to submit a few brief statements anent the controversy as to what constitutes "butter", what constitutes "adulterated butter", and what constitutes "renovated butter", under the terms of the Oleomargarine Act of 1902 and the National Food and Drugs Act of 1906 and the interpretation of certain views of those laws by the United States Attorney General as recently given to you.

We accept without reservation the definition of butter as set forth in Section I of the Act of Congress of August, 2, 1896, 24 Stat., known as the Oleomargarine Act as follows and as quoted by the Attorney General of the United States, to-wit: "The word 'butter' shall be understood to mean the food product usually known as butter, and which is made exclusively from milk or cream, or both, with or without common salt, and with or without additional coloring matter.

So far as the United States authorities are concerned in this matter, this is the compelling definition for "butter".

In a similar manner what constitutes adulterated butter within the meaning of the Act of Congress of May 9, 1902, 32 Stat., 194 is as follows:

"Adulterated butter" is hereby defined to mean a grade of butter produced by mixing, reworking, rechurning in milk or cream, refining, or in any way producing a uniform, purified, or improved product, from different lots or parcels of melted or unmelted butter or butterfat, in which any acid, alkali, chemical, or any substance whatever is introduced or used for the purpose or with the effect of deodorizing or removing therefrom rancidity, or any butter or butterfat with which there is mixed any substance foreign to butter as herein defined, with intent or effect of cheapening in cost the product or any butter in the manufacture or manipulation of which any process or material is used with intent or effect of causing the absorption of abnormal quantities of water, milk, or cream;"

And in a similar manner what constitutes "process butter" or "renovated butter" is likewise defined in the aforesaid Oleomargarine Act of May 9, 1902, as follows:

"Process butter" or "renovated butter" is hereby defined to mean butter which has been subjected to any process by which it is melted, clarified, or refined and made to resemble genuine butter, always excepting "adulterated butter" as defined by this Act."

Our information is to the effect that the United States Secretary of the Treasury October 11, 1920, submitted to the United States Attorney General the following questions:

1. Is a grade of butter produced from decomposed or rancid cream, which has been neutralized with chemicals before churning, adulterated butter within the meaning of Section 4, Act of May 9, 1902, and therefore, taxable as such; and

2. Is a grade of butter produced from cream which is high in acid and has a bad odor, and which has been neutralized with chemicals before churning, adulterated butter within the meaning of Section 4, Act of May 9, and, therefore, taxable as such?

Our information is to the effect that the Attorney General advised the United States Secretary of the Treasury, that under the definitions of "butter", "adulterated butter", and "process or renovated butter", the grade of butter produced as described in each of the two questions presented is "adulterated butter" and taxable as such.

Mr. Commissioner, we challenge that conclusion of the United States Attorney General as unwarranted and unfounded by the terms of the Act of Congress of 1902 defining "adulterated butter", and we most respectfully ask your careful consideration to the error which the United States Attorney General has made in arriving at this conclusion.

Concerning the so-called grades of butter described in the two questions submitted, he states: It cannot be considered "butter" as it is not made exclusively from milk or cream, or both, with or without common salt, and with or without additional coloring matter. He asserts that is is not "process" or "renovated butter" for reasons which he assigns. In these two contentions we agree with him absolutely. But he then says, "I conclude therefore that Congress intended to include such butter within the definition of 'adulterated butter' under Section 4 of the Act of 1902, ante, since it appears to be a purified or improved butter which is the result of processes during which substances have been introduced and used for purpose of and with the effect of deodorizing and removing rancidity."

We emphatically deny the accuracy of this conclusion as above quoted as it is unwarranted by the terms of the law and the facts in the case. In this conclusion, the United States Attorney General takes into consideration only a part of the definition of adulterated butter and not the entire definition. He has no right to form a conclusion from a part of that definition and not take into consideration the entire definition and the true meaning of words as used in the various parts of that definition. He has no right to hold through a process of exclusion that the butter described in the questions is "adulterated butter", because it is not "butter", and because it is not "renovated" or "process butter".

Referring to the recognized definition of adulterated butter as quoted in the Oleomargarine Act, there are in that definition three distinct specifications of conditions under which butter is declared to be "adulterated butter":

1. "A grade of butter produced by mixing, reworking, rechurning in milk or cream, refining, or in any way producing a uniform purified or improved product from different lots or parcels of melted or unmelted butter or butterfat, in which any acid, alkali, chemical, or any substance whatever is introduced or used for the purpose or with the effect of deodorizing or removing therefrom rancidity."

2. "Any butter or butterfat with which there is mixed any substance foreign to butter as herein defined, with intent or effect of cheapening in cost the product."

3. "Any butter in the manufacture or manipulation of which any

process or material is used with intent or effect of causing the absorption of abnormal quantities of water, milk, or cream."

To hold that the finished products resulting from the use of the substances portrayed in either of the questions submitted to the Attorney General and hereinbefore quoted, is "adulterated butter" within the meaning of said definition of adulterated butter, and therefore subject to taxation, it is absolutely necessary to hold that the terms "melted or unmelted butterfat" are one and the same thing as the terms "milk, cream". That is to say that these terms are interchangeable in the said definition. This reduces the said contention to an absurdity. If those terms are interchangeable in meaning, then specification I in the definition of "adulterated butter" can read as follows: "A grade of butter produced by mixing, reworking, rechurning, *in melted or unmelted butterfat*, refining, or in any way producing a uniform, purified, or improved product from different lots or parcels of melted or unmelted butter, or milk, or cream."

Stated in another form: "Congress in its definition of adulterated butter intended to provide for the manufacture of adulterated butter by permitting the working, churning, or reworking of different lots of butter or milk or cream by reworking or churning in milk or cream." It is absurd to think that Congress intended to provide for the purification of milk or cream by working, reworking, or churning *milk or cream* in milk or cream; which conclusion must inevitably follow if the term "melted" or "unmelted butter" is one and the same term as "milk" or "cream". It is in such an absurd attitude that the United States Congress is placed if the aforesaid terms are interchangeable.

Referring now to the second specification in the definition of "adulterated butter" above cited the question is, what does this second specification seek to accomplish?

Demonstrating in the remarks on specification I that "melted" and "unmelted butterfat" is not one and the same thing as "milk" or "cream", the object of specification II of the definition of adulterated butter as set forth above is to bring within the terms of the definition of adulterated butter any butter or butterfat with which there is mixed any substance foreign to butter as herein defined with intent or effect of cheapening in cost the product. The United States Attorney General in his opinion has nowhere contended that there is any foreign substance introduced into the finished product produced from the substances portrayed in each of the above questions above with intent or effect of cheapening in cost said finished product. There is a very good reason why he has not made that contention for it cannot be successfully shown. Therefore it is an absurdity to hold that the finished products resulting from the use of the products described in questions I and II come within the second specification of the definition of "adulterated butter" and as such is subject to the Internal Revenue tax.

Referring now to the third specification in the definition of adulterated butter as set forth above. The object of specification III is to bring any butter in the manufacture or manipulation of which any process or material is used with intent or effect of causing the absorption of abnormal quantities of water, milk, or cream. The United States Attorney General does not contend and he cannot successfully maintain that a neutralizer is used with the intent or effect of causing the absorption of abnormal quantities of water, milk, or cream in the finished product.

Therefore, he cannot maintain that the finished product resulting from the use of the products described in questions I and II comes within the third specification of the definition of "adulterated butter" and as such is subject to Internal Revenue taxation.

Congress has provided by law the regulation and control of products resulting from the use of the materials as described in questions I and II submitted to the Attorney General, but inasmuch as the law thus enacted by Congress does not come under your jurisdiction we do not discuss it in this communication.

Mr. Commissioner, for reasons hereinbefore set forth, we contend that you are without authority of law to impose a revenue tax upon the finished products resulting from the use of materials as described in questions I and II; and that such action on your part would be usurpation of power based upon an erroneous conclusion.

FEED UP

Do This—

Give your dairy feed the *PROFIT-OVER-FEED* test. Weigh your feed. Weigh your milk. At the end of a month, subtract the cost of the month's feed from the month's income from the milk. Put this figure* down where you can refer to it in thirty days.

Then, ask your dealer for BUFFALO CORN GLUTEN FEED, the protein feed that makes milk. Mix up yourself, at home, 2 parts of BUFFALO CORN GLUTEN FEED, with 1 part of wheat bran or mill feed, and 1 part of ground oats. *You can mix up a ton in a half-hour—and few jobs will pay you better.* Feed this mixture liberally. Keep the daily feed and milk records for another month, as before. Then subtract the cost of the month's feed from the month's returns from the milk. Check this margin-of-profit figure* with the other one.

It probably won't take a whole month to convince you that it pay$ to feed BUFFALO CORN GLUTEN FEED.

Write us for literature giving mixtures for feeding BUFFALO CORN GLUTEN FEED. *If your dealer cannot supply you, tell us who and where he is. Write to*

Ayrshires on Reymann Memorial Farms

ROSS B. JOHNSON, WEST VIRGINIA

ONE of the greatest herds of pure-bred Ayrshire cattle in the United States is being developed on the Reymann Memorial Farms, West Virginia, which comprise the largest separate branch of the experiment station of the college of agriculture of West Virginia University. Already these farms have 121 pure-bred females, making the largest herd of pure-bred Ayrshires owned by any experiment station in this country. The farms, two in number, comprise a total of 931 acres and were given to the state university by the Reymanns of West Virginia.

As these farms are situated fifteen miles from a railroad, the entire product of this dairy herd is converted into cheese and is then marketed by parcel post. The monthly production is about 3,000 lbs. and not more than three cheeses go to any one person. No cheese is sold to wholesalers, the product largely going to retail stores, hotels, and to individuals. In addition to supplying people in many parts of West Virginia, the farms ship to points in Texas, Missouri, New York, and other states. This cheese took second prize at the National Dairy Show in 1918.

During the last year, thirteen cows, seven of which were heifers with their first calves, qualified for the Advanced Registry of the breed with an average production of 9,476 lbs. of milk, 427 lbs. of butterfat. Eleven more cows, nine of which are two-year-olds, have been entered for the official test this year and several more will be entered a little later.

The best record of production during the past year was nearly 14,000 lbs. of milk, 512 lbs. of fat, this record being made by Whitey Nox, a six-year-old cow. The next best record was made by Cacapon Nancy, a three-year-old cow, with a production of nearly 12,000 lbs. milk, 497 lbs. of fat. These records were made on feed grown on the farms with cottonseed meal as a supplement. The average production of the herd the past year was almost twice what it was two years ago. The average size of the cows has also increased.

AYRSHIRES AT PASTURE ON REYMANN MEMORIAL FARMS, WEST VIRGINIA

Dairying on the Ranges

HOARD'S DAIRYMAN:—Recently four hundred stockholders and patrons of the Farmers' Creamery Company of Williston, North Dakota, held the annual dinner and meeting of the association. The secretary's report showed that during 1920 the creamery had received 267,593 lbs. of butterfat and paid out for it $138,513.13 as compared with 142,365 lbs. received in 1919 for which $88,635.13 was paid. The company, composed of farmers of Williams and McKenzie Counties, has increased its volume of cream business 53 per cent.

The two counties are in the northwestern corner of North Dakota, in the section so severely hit by drouth last year. The main business of the farmers of the new country is wheat growing. Those who depended upon their wheat last season, harvested a minimum crop, and then on top of that the bottom fell out of the price of wheat. They have been and still are up against the bitterest of hard times. Perhaps no more striking demonstration of the value of dairying could be cited, than the fact that in the face of such a situation the farmers who have milk cows along with their wheat have come out at the end of the year with a 53 per cent increase in their farm returns.

The wisdom of introducing a creamery at the earliest possible moment on the frontier is also demonstrated. A large part of the country tributary to the Williston Creamery is just emerging from the homesteading stage. Until a few brave spirits got together and established a creamery at Williston, there was no market for cream, and a milch cow except for the family supply of milk and butter was a profitless investment. The few village stores on the prairie could take a little butter, but such a small amount that farmers trying to market butter with them were not seldom told, "Sorry, but I can't take your butter today. We have more than we can get rid of." Those were pre-railroad days.

A few years ago the Great Northern railroad which passes through Williston built a couple of spurs, one north and one south from Williston. It was then a handful of farmers and merchants who ventured to found a creamery. Stores in the tiny new villages along these branch lines were solicited to collect cream from the farmers and ship to Williston. At first there was no cream to collect, but gradually a few farmers began to bring in a little cream. When they received cash in return it set them going, for cash is a scarce article in the homesteading areas. From such a beginning the Williston Creamery has grown in a few years to its present size. It is now housed in a new hundred thousand dollar building.

But to get the whole story of this pioneer creamery one should go back

to the time not more than twenty years ago when McKenzie and Williams Counties were still a part of the "Ranchers' Paradise", and thousands of "Long Horns" roamed their prairies. It was then, as the story goes, that a tenderfoot who visited one of the round-up camps made the famous remark, "A funny country. Hundreds of horses and not one to ride—thousands of cows and not a drop of milk to drink or a bit of butter to eat." In those days they figured it required twenty acres of land to raise one beef for market. Now there are quarter sections with fifty head of dairy cattle on them.

There was a picturesqueness about the old cattle days on the Missouri slope, but it was not all romance. The writer of western stories and the cowboy movies tell one side of the free range story; there is the other, the bellowing of starving, freezing cattle and the piles of bones which dotted the prairies each spring. Twenty per cent loss from starvation and exposure was what the western Dakota cattlemen figured on. With no feed to buy, no taxes on land to pay, no care to give their herds except to round them up in the spring to brand the calves and in the fall to "cut out" the beef for market, they easily grew rich from the sale of the eighty per cent that came through the winter alive.

With the curtailment of the range by settlement, ranching has lost some of its picturesqueness, but it also has lost its inhumanity and its extravagant wastefulness of live stock and land. The twenty acres which used to be required to grow wild grass enough for one steer now can produce corn, alfalfa, soy beans, and sunflowers enough to feed a nice little dairy herd. It is only lately that this discovery has been made, however. The wheat farmer until very recently had an undisputed sway in the region as had its predecessor, the cattleman.

The Williston Farmers' Creamery is showing the way to the third era, the era of stabilized prosperity when the dairy cow will take the throne from King Wheat, just as King Wheat usurped the authority of the Long Horn.

Iowa. F. L. CLARK.

Propaganda for Guernseys

Speaking before the Wisconsin-Illinois Guernsey Breeders' Association in Madison, February 10th, H. W. Griswold presented data as evidence of the breed's superiority in economy of production. His figures were gathered from Circular 129 of the University of Wisconsin which lists the production of and the ration fed to the Register of Production cows of Wisconsin cow testing associations in 1919-20.

In his analysis, Mr. Griswold stated that the average fat production of Guernseys and Holsteins was very nearly equal. The days of pasturing were about the same. The Holsteins average to consume 7,533 pounds of silage and the Guernseys 7,017 pounds. Holsteins consumed 1,607 pounds of hay and Guernseys 1,909. In grain consumed the Holsteins were charged with an average of 2,446 pounds and Guernseys with 1,748 pounds. Mr. Griswold estimated that the Holsteins consumed one pound of grain for each 3.7 pounds of roughage, while the consumption of grain by the Guernseys was one pound for each 5 pounds of roughage. When silage is valued at $5 per ton, hay at $20, and grain at $40, he calculated that, making the same fat production, it costs $13 more to feed the average Holstein cow for a year than to feed the average Guernsey.

Kodak on the Farm

On the farm Kodak serves a double purpose. Like the auto it is ready for business or for pleasure.

It is always ready for pictures in and about the home. The children, the family pets, the grange picnic, the thousand and one familiar scenes around the farm—all these contribute delightfully to the family Kodak album.

And there's a worth-while business use for the Kodak on every farm. It keeps a record of crop and orchard growths, the progress of building, the condition of the "line fence." It sells live stock.

And picture taking by the Kodak method is simpler and less expensive than you think. A catalogue of Kodaks and Brownies free by mail or at your dealer's.

Here's a guarantee that means something. Take us up on it.

Pick out any cow in your herd—say, the one that seems to be "holding out" on you. Feed her CE-RE-A-LIA SWEETS for 4 weeks. If chart does not show *profitable* increase in milk yield or test, you get your money back. If it does, you've learned how to put your herd on a paying basis, at the lowest cost per pound of milk. You win either way.

The Early & Daniel Company

I'm interested. Send chart and details of 4 weeks trial of Ce-re-a-lia Sweets.

HE SMOKES MEAT WITH OUT A FIRE

Washington Farmer Simply Applies Liquid Smoke—Flavor is Improved and All Shrinkage Prevented

Victor Hillhouse of Conconully, Wash., has no use for a smokehouse. In a few hours, without fire or loss, Mr. Hillhouse cures his meat by simply painting it with Wright's Smoke. "I am convinced that it is the only system of smoking meat," says Mr. Hillhouse. "No more of the old way for me. I wouldn't be without Wright's Smoke if it cost $10 a bottle."

Thousands have found that the Wright method improves the flavor, keeps meat sweet and free from insects and prevents all shrinkage, saving 20 lbs. in every 100. Wright's Ham perfection without trouble or loss.

Wright's Smoke and Wright's Ham Pickle cost little at any drug store. If your dealer hasn't the genuine, guaranteed Wright Food Products, write E. H. Wright Co., 847 Broadway, Kansas City, Mo., for free book.

KING SEGIS PATENT LOCK

Ear Tags, Bull Staff and Rings. Description and prices sent on application. 300,000 of these ear tags have been sold without adverse criticism. 500 of these Bull Staffs are used by the best breeders in the business.

Association Notes

Canaan, Connecticut:—During January 12 boarder cows were culled. Three per cent market milk sold for $3.34 per cwt. Feed prices are: hay, $25 per ton; silage, $8; cottonseed meal, $45; corn and oats, $43; gluten, $60; oil meal, $54; bran, $43.50; middlings, $43.

Claremont—Lebanon, New Hampshire:—The farmers bought a carload of grain during January at a considerable saving. One member purchased a year-old Jersey bull. January market milk sold for $3.50 per cwt. The creamery paid 56c per lb. for fat. Milk retails for 12c per quart and butter for 65c per pound. Feed prices: mixed hay, $20 per ton; silage, $9; oats, $46.40; bran, $44; gluten feed, $61; cottonseed meal, $48; oil meal, $50; corn meal, $40.

Troy, Pennsylvania:—The average for the ten highest producers in the association in January was 62.2 lbs. butterfat. Three per cent market milk sold for $3.04 per cwt. The creamery paid 63c per pound for fat. Milk retails for 10c per quart and butter for 55—60c per pound. Feeds sold as follows: gluten, $2.75—$3 per cwt.; oil meal, $2.85—$2.95; cottonseed meal, $2.75—$2.95; corn meal, $2.30; buckwheat and oats, $2.25; wheat middlings, $2.40; bran, $2.30.

Barnesville, Ohio:—January 3.5% milk sold for $2.90 to $3.40 per cwt. and 5c per point above this test. Local feed prices: Larro, $2.85; bran, $2.10; oil meal, $3; cottonseed meal, $3; hominy, $2.50; gluten, $2.75; beet pulp, $3; corn, 90c per bushel; oats, 70c.

Porter County Co-operative, Indiana:—Two scrub sires were sold during January, and a pure-bred Holstein bull purchased. This association is now free from scrub sires. Six unprofitable cows were also disposed of. Market milk testing 3.5% sold for $2.50 per cwt. The creamery paid 44c per pound for fat. Milk retails for 15c per quart and butter for 50c per pound. Feed prices are: alfalfa, $20 per ton; other hays, $18; ground corn, $22; corn and cob meal, $18; bran, $35; gluten feed, $50; cottonseed meal, $48; oil meal, $60; hominy, $38; ground oats, $25; silage, $5.

McCracken County, Kentucky:—One pure-bred Jersey bull was brought in from Christian County in January. One carload of bran was bought co-operatively. Market milk testing 3.6% sold for $4.50 per cwt. and 6c per point above. The creamery paid 46c per pound for fat. Bran sold for $32 per ton; cottonseed meal, $36—$41; crushed corn, $25.

Western Allegan County, Michigan:—Two members report the same results at a smaller cost when they changed from a ready mixed feed to a ration suggested by the tester and mixed themselves. January 3.5% milk sold for $2.25 per cwt., a premium of 4c per point above this test

A 1-Piece Cow Stall

ONE Attachment

THAT describes the CLAY Cow Stall. Easily and quickly put up—and *stays up*. Nothing to break. Warranted not to bend. For bigger dairy profits—through safety, sanitation and a saving of time, feed and labor—equip with the

CLAY SANITARY ONE-PIECE STALL

Strong Smooth Steel Tubing No Angles, Joints Or Heavy Castings

Simplest, strongest cow stall made. Outlasts the barn. Designed with the help of hundreds of dairy farmers who *know* what the dairy farmer needs. None of the faults of old-style stalls — all of the good points barn equipment can have.

CLAY Equipment will save you *hours* every week, keep your herd comfortable and contented and pay dividends from the start in a bigger yield of milk.

CLAY 2-Way 1-Hand Stanchion

Instantly closed or opened *both* ways with *one* hand. Eliminates troublesome sure-stops. Locks at 6½, 7½, or 8¼ inches—fits either cow or heifer without change. Hangs squarely in center of stall—cow can't miss it. Lock guaranteed brute-proof.

YOU CAN MAKE MORE MONEY

CLAY Guaranteed Equipment makes dairy-barn work quick, easy, pleasant. In hundreds of dairy barns it has quickly paid for itself and increased cow earnings. It will make money for you.

FREE Book and Barn Plans. Just send your name—a card will do—Money-making Barn plans. No obligation. Write us now.

IOWA GATE CO.
902 Clay Street, CEDAR FALLS, IOWA.

being paid, and 6c per point above 4%. The creamery paid 45—52c per pound for fat. Feed prices: hay, $17—$20 per ton; silage, $6; bran, $40; cottonseed meal, $43—$50; Unicorn, $67; corn and oats, $40; middlings, $48; oil meal, $60.

Kent County Co-operative, Michigan:—January market milk testing 3.5% sold for 2.40 per cwt. The condensery paid 54c per pound for fat and the creamery paid 50—58c per pound. Milk retails for 15c per quart and butter for 53c per pound. Prices charged for feeds are: oil meal, $50 per ton; cottonseed meal, $45; corn meal, $42; oats, $38; gluten, $43; bran, $37; Unicorn, $62.50; Larro, $65; silage, $8; alfalfa, $25; clover, $20; timothy, $16.

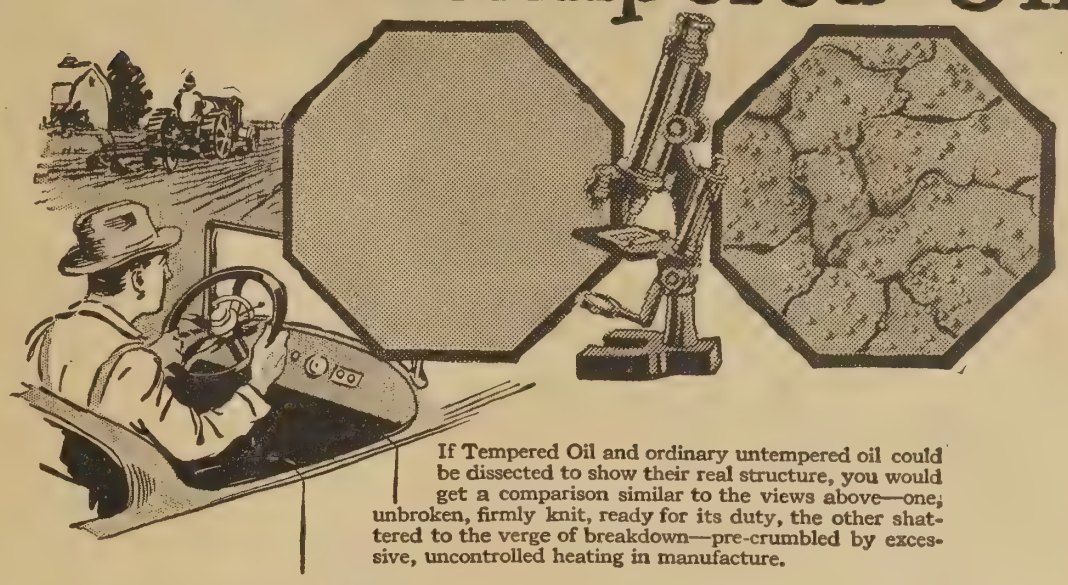
Wilton, Wisconsin:—Out of 300 tuberculin tested cows, the 4 reactors were disposed of at once. During January the creamery paid 72c per pound for fat. Feed prices are: corn, 55c per bushel; oats, 50c; barley, 90c; bran, $32 per ton; oil meal, $48; alfalfa, $27.50; mixed hay, $18.

Ellington, Wisconsin:—Thirteen herds were tested for tuberculosis and only four reactors were found. One herd has been entered on the accredited list, making a total of four herds in the association now on the list. Nearly all members are feeding oil meal as a part of their ration. Very little ready mixed dairy feeds are being fed by members. Cows show larger profits from home-prepared rations. During January the creamery paid 47c per pound for fat, and the cheese factory paid 53c per pound. Milk retails for 8c per quart, butter for 50c per pound, and cheese for 24c per pound. Feed prices are: silage, $6 per ton; mangels, $5; clover hay, $18; alfalfa, $26—$28; bran, $34; oil meal, $49; Queen Dairy, $45; oats, 37c per bushel; corn, 60—65c; barley, 65c.

Delaware County, Iowa:—Two pure-bred Holsteins were purchased in January. The creamery paid 60c per pound for fat. Milk retails for 12c per quart and butter for 55c per pound. Feeds are bought at the following prices: corn, 60c per bushel; oats, 40c; oil meal, $45 per ton; bran, $30; cottonseed meal, $40.

Monona—Farmersburg, Iowa:—Eleven cows were sold and seven purchased during January. One member has purchased a Holstein bull whose dam produced 859 pounds butter as a 3½-year-old and whose sire's dam produced 1,077 lbs. butter. Sixteen cows in the association produced over 50 lbs. fat; the association average being 28.22 lbs.

Pioneer, Minnesota:—Market milk sold for $4.75 per cwt. in January. The creamery paid 64c per pound for fat. Milk retails for 12c per quart and butter for 58c per pound. Feed prices are: hay, $10—$15 per ton; silage, $3—$5; bran, $28—$47; oil meal, $38—$67; corn, 40—50c per bushel; oats, 35—50c per bushel.



Blue Earth Couny, Minnesota:—This is the second month of testing in the new year and results are very gratifying. The association is "one hundred per cent" in the use of pure-bred sires. The grade herd of Holsteins owned by E. D. Oliver produced an average per head of 63.71 lbs. fat during December. They were milked three times a day. The high cow produced 84.5 lbs. fat during the month. Sixteen herds are either on the tuberculosis-free list or under federal supervision. Thirteen members have electricity in their homes. Ten members have drinking cups in the barns, and find them a good investment. The feeding of balanced rations has made a marked improvement in many herds. The average price for fat in December was 64c per pound. Milk retails at 12c per quart.

Columbia County, Oregon:—Four unprofitable cows were sold for beef in January. Two more pure-bred bulls were purchased. One carload of barley, oats, and corn meal was cooperatively purchased. An increased amount of grain is being fed in the association, with a balanced system of feeding. The cheese factory paid 56—59c per pound for fat in January. Feeds sold as follows: mill run, $1.60 per 80 lbs.; Cascade Chop, $2.20 per cwt.; ground barley, $3; molasses feed, $2.35; oil meal, $4.25; alfalfa meal, 2c per pound; alfalfa hay, $22 per ton; cocoanut meal, $39.

Marin County, California:—The hills are green here and cows are getting a little grass, but dairymen are beginning to realize the need of the

(Continued on page 288)

Breakdown Comes Sooner In Untempered Oil

If Tempered Oil and ordinary untempered oil could be dissected to show their real structure, you would get a comparison similar to the views above—one, unbroken, firmly knit, ready for its duty, the other shattered to the verge of breakdown—pre-crumbled by excessive, uncontrolled heating in manufacture.

OIL fit for motor use can stand only a certain amount of heat. By its very nature it must thin out, break down and wear away after just so much has been endured.

The tremendous roasting or "over-cooking" necessary in making oil by ordinary refining processes, shortens its life just as would so much use in your motor—cuts down its power of heat resistance in advance and steals away the first prime vigor of the oily body before the oil is ever used.

In the Wasteless Easy-Pouring Top Tip Can

Wadhams *Tempered* Motor *and* Tractor Oil

is made by the exclusive "Tempering" process that avoids this superheating during manufacture.

This oil goes into your car with full lubricating strength, ready to expend its ***whole life*** of usefulness in the proper place—your motor instead of in the refining machinery.

At your dealer's in correct weights for every car, truck and tractor

Its worth shows in longer life, safe and certain lubrication under the severest heat, and almost complete freedom from carbon.

EDITORIAL COMMENT

A PHENOMENAL COW

A Michigan reader writes to ask for suggestions concerning his Holstein cow which he reports is producing 70 lbs. of milk per day with an 8.4% test when milked twice daily. He states, "I am feeding timothy hay and oats only" and asks, "Is this considered a good record?" and "would it be advisable to give her the state official test?"

Surely such a cow should be given official recognition at once that she may be acclaimed the world record producer on the world record poor feeding.

MAGNITUDE OF AGRICULTURE

Farming is the largest industry in the United States. Few people comprehend its magnitude. The officials of the National Association of State Marketing estimate that the farmers of the United States sell a sufficient amount of farm products to load 23 cars a minute, valued at $20,000, and buy $200 worth of farm supplies every time the clock ticks. They also estimate that during the next decade farm products will amount to 225 million carloads, valued at not less than 175 billions of dollars and that more than 100 millions of dollars' worth of this will be placed upon the market. They estimate that farmers will buy not less than 60 million dollars' worth of farm supplies. The purchasing power of the farmer and the magnitude of his business are not appreciated until the total account is brought together and then the figures are so large they cannot be comprehended.

CAUSE FOR OPTIMISM

How prone people are to think that their occupation is suffering more than others. In this time of readjustment, when everything seems to be going contrary to the way it should, there is opportunity to look around and find persons much worse off than those engaged in agriculture.

It has been estimated that 28 per cent of the labor in the Atlantic States is unemployed at the present time and in the Middle West, from Pittsburg to Chicago, more than 50 per cent. Being out of work in these times of high priced commodities is a serious matter and the farmer may well appreciate that his occupation gives him labor, three square meals a day, plenty of clothing to wear, and he knows where he is going to sleep at night. It is to the interest of agriculture that all people be employed and at good wages for it is the laborer who furnishes the large market for farm products.

PROVIDE FOR LEAN YEARS

Some economists believe it is the duty of the farmer to market all his produce and to liquidate his debts as far as possible. They believe this would materially assist in bringing the country back to normal. We do not look upon the situation in this way. It seems to us the farmer will not be conducting his business to the best advantage until he markets his crops throughout the year and in some instances extends the period over more than a year. Marketing of many crops at the time of harvesting depresses prices and the farmer loses by it.

Professor G. F. Warren of Cornell University, New York, says: "We have not yet developed means for financing and storage of large crops. A considerable part of such crops should be held for more than one year. The popular idea that it is wrong to store more than one year needs to be revised. The crops of the good years should be used to supplement poor years."

Without doubt Professor Warren had in mind Pharaoh's dream and Joseph's interpretation of it. It will be remembered that Pharaoh dreamed that he stood by the river—"And behold, there came up out of the river seven well favored kine and fatfleshed and they fed in a meadow. And, behold, seven other kine came up after them out of the river, ill favored and leanfleshed; and stood by the other kine upon the brink of the river. And the ill favored and leanfleshed kine did eat up the seven well favored and fat kine. So Pharaoh awoke. And he slept and dreamed the second time; and, behold, seven ears of corn came up upon one stalk, rank and good. And, behold, seven thin ears and blasted with the east wind sprung up after them. And the seven thin ears devoured the seven rank and full ears. And Pharaoh awoke, and, behold, it was a dream."

It was Joseph who pointed out to Pharaoh that "the seven good kine are seven years; and the seven good ears are seven years; the dream is one. And the seven thin and ill favored kine that came up after them are seven years; and the seven empty ears blasted with the east wind shall be seven years of famine." Because Joseph interpreted Pharaoh's dream, he was made ruler of Egypt and he traveled up and down this land urging the people to store their corn in the years of plenty for the years of famine that were to come. And it should be remembered that "when all the land of Egypt was famished, the people cried to Pharaoh for bread; and Pharaoh said unto all the Egyptians, 'Go unto Joseph; what he saith to you, do.' And the famine was over all the face of the earth; and Joseph opened all the storehouses, and sold unto the Egyptians; and the famine waxed sore in the land of Egypt. And all countries came into Egypt to Joseph for to buy corn; because that the famine was so sore in all lands."

We should have as much wisdom as Joseph and the farmers of this country may well be held responsible for providing storage in order to have an adequate supply for the lean years.

QUALITY PAYS

We wish it were possible to impress upon every milk producer the importance of producing a high quality product. It seems to be difficult for all dairymen to comprehend how important it is to produce a high grade of milk in order that there may be produced from it the finest butter and cheese.

A farmer in Vermont, producing milk for direct consumption, felt that he was not being paid for having his milk thoroughly cooled and aerated. He thought the consumer did not appreciate this effort and that he was not being fully compensated for the extra service he was putting into the production of his product. He learned his mistake when he happened to be in the store where his milk was sold. A customer entered and asked for his milk. Being informed that there was none of this man's milk on hand, the customer inquired when another delivery would be made. The storekeeper told him it would be the next morning but informed him that he had other milk. The customer preferred this particular milk and waited until morning that he might have some of it. He was not only willing to pay a higher price for it, but to make another trip to the store.

Two things are accomplished when dairy products are of high quality; the consumer is willing to pay a higher price for them and he will consume more of them, both highly advantageous to the advancement and profits of dairy farmers. This would be appreciated by a greater number of farmers if they were in position to receive the reflex action of the market. The farmer who heard the customer call for his milk and refuse to accept any other milk, learned that it pays to produce a high quality product. He has had his lesson from the person who buys his milk.

HERE'S WHY FARMERS UNDERVALUE SKIMMILK

"Yes, I can inform you." This is in response of an Indiana reader to our editorial comment, in the issue of Hoard's Dairyman for February 11, concerning those farmers who are indifferent to the feeding value of skimmilk. "I can make a guess," he continues, "that these same farmers are only half alive to the value of ensilage, or alfalfa, or the tuberculin test. They milk cows, but they do not recognize that they are dairymen. They keep poultry, but they would roundly deny that they are poultrymen. Neither are they sheepmen, though their farms keep some sheep; and in spite of the fact that they have some hogs they would tell you that they are not swine breeders. In short, they are crop raisers and stock multipliers, excellent in their way, perhaps, but impelled by no very generous and satisfying ambition.

"If these farmers read farm papers it is not with the vital spark of understanding, but with a smoked glass kind of a mind. Their business is not with them a profession to be studied and perfected. It is mostly an occupation from which to get a living, and to be gotten through with to the point of making retirement possible and old age leisure.

"These farmers live up and down my road, and I call them by their first names. As I see it, the main matter for them is the negative kind of an education provided for them in the public schools of forty years ago, and even ten; and worse than that, still far too common today. In short, I believe, and so do school authorities the country over, that the rural schools need reforming into modern day institutions; they are administered by people who are not rural minded, taught by teachers who are not rural minded, and turn out a product that is not rural indeed. To very many of the pupils the deadening book grind was and still is a bore, and they left school, and are still leaving it, with indifferent mastery of even the mechanics of reading. How can Hoard's Dairyman, or any other farm paper grip the attention and convictions of such farmers. Rural schools for rural children will give us a new rural population in due time."

DAIRY TEMPERAMENT

Gradually it is dawning upon the minds of farmers that the thing we call "dairy temperament" in cows plays a big part in the work they do. As an illustration of what it does we quote from the report of one of the agents in a dairy cow testing association. He says:

"In one of the herds of this association we found a little grade Guernsey that weighed 820 lbs. and she made 410 lbs. of butterfat, actually half her weight in butterfat."

What did this? Some would say it was the breed. But there are plenty of Guernseys, some of them pure-bred, as there are in all breeds, that will not come up to the mark of this little cow. The cause must lie deeper than breed, although we have more of such cows in breeds that have been bred along the lines of dairy temperament.

What is this mysterious force that creates such powerful differences in the outcome of animal life? We see it in race horses. It is the same in dogs and fowls bred and developed for special purposes. It seems to underlie all demonstration of superior ability or capacity in men as well as animals without much regard to size. It manifests itself to a certain extent in form and type but even here it has its own independent way. Cows of faultless type are sometimes far below in yield to those of inferior type.

It is difficult to define temperament in words. As near as we can come to it is this: A strong predisposing tendency in the individual toward performance in a given direction. Whatever it is it must be reckoned with in all our breeding operations. With dairy cattle we must select our breeding animals as much as possible from those that show decided dairy temperament as well as type if we hope to keep in line with our central purpose.

Seeding Alfalfa With Fertilizer—Use of Acid Phosphate

Please tell me if alfalfa seed can be safely sowed without damage from fertilizer where 600 lbs. of equal parts of ashes from wood, 16% acid phosphate, and chicken manure are ground up together and all sowed in the same furrow with a fertilizer drill, 600 lbs. per acre. How much 16% acid phosphate can be put safely to the acre on wheat in the spring?

Springtown, Ark. T. B. L.

Owing to the fact that well rotted hen manure is relatively high in ammonium salts, the chemical reaction resulting between the calcium content of the wood ashes and these salts might liberate ammonia which would not only mean a loss in the available nitrogen of the manure, but in addition there might be a deleterious effect upon the alfalfa seed. However, we are not inclined to believe that any serious consequences would follow. If it is practicable for you to do so, it might be well to incorporate the ashes with the soil sometime previous to applying the other fertilizer and sowing the seed.

The general recommendation is to use from 150 to 200 lbs. of acid phosphate for each grain crop in a rotation. The only danger from heavier applications is in creating a too acid condition in the soil. No absolute standard can be fixed because of the varying phosphorus content of the soil and the demand of the particular crop. It would ordinarily be possible to apply at least 300 lbs. acid phosphate to wheat without danger, but it would be uneconomical when 180 lbs., say, would be sufficient.

Cost of Making Cheese

A cheesemaker owns the cheese factory and equipment, furnishes all the supplies and all the labor; how much per pound ought he to be paid by the patrons for making cheese known as Daisies? The factory in question receives 2,262,599 lbs. of milk in a year.

In the factory mentioned, the whey separator was paid for by the sale of butterfat skimmed, the cheesemaker owning all the rest of the equipment. How much per thousand pounds should he receive for skimming the whey? On the basis of sales of skimmed butterfat, what percentage of the sales should he receive?

Wisconsin. C. R. P.

The exact cost of making cheese varies at different factories according to the various conditions such as the interest and depreciation charge which must be made on the factory building and equipment. Some makers have a poorly built, small factory building on which the interest and depreciation charge is small. Others have more investment and cost.

The labor charges also vary somewhat at different factories. We have found so much difference in factory costs that we have advised that every maker should figure his own costs, and have issued a bulletin showing how this can be done.

As a general average figure for the cost of making Daisies at the present time, I would say that 3½c or 4c is about right. Where the cheesemaker is to be paid for his labor, in running a separator, he might charge $15 a month extra for this work.

The maker is sometimes paid ½ of the whey cream money, which amounts to ½ to ¾c a pound on the cheese, and in this case the price per pound of making cheese is often reduced somewhat so as to make the maker's entire pay for making cheese and skimming whey equal to about 1c a pound for his labor.

The cost of his supplies, etc., is likely to equal about 3c a pound, making the total cost for making cheese very close to 4c a pound.

Wis. Coll. of Agriculture. J. L. SAMMIS.

Ration Lacks Protein

I would like information about feeding of good grade Holstein cows. I have ten head, all fresh recently. Proper feeding I feel will increase the production of milk, which is not very large just now. Am feeding about one and one-half bushels of good corn silage twice a day. Besides this we are giving the cows cut fodder—all they can handle. I have some corn and oats which I could feed, also have a good power grinder. What proportion of each shall I grind, how much ought to be fed, and would it be profitable to add some other meal such as linseed or cottonseed?

Gibsonburg, Ohio. A. W. A.

This ration is very low in its protein content and for that reason production must necessarily be limited. The herd will benefit very greatly from the addition of protein feeds. Not only should such feeds greatly increase the milk flow of the herd but they should reduce the cost of production per hundred pounds of milk.

There are two ways of supplying this needed protein: through the purchase of a legume hay such as clover or alfalfa, or through the feeding of oil meal or cottonseed meal. We believe it advisable to feed clover or alfalfa in as large amounts as the cows will eat, feed silage at the present rate or in somewhat lesser amounts, and feed as much corn stover as the cows will pick over.

In addition a concentrate mixture of 300 lbs. of ground corn, 200 lbs. of ground oats, and 100 lbs. of oil meal or cottonseed meal, fed at the rate of one pound for each four lbs. of milk produced, should give good returns. We believe this will increase profits.

The Small Diameter Silo

Two eight-foot silos thirty-two feet high will feed ten head of cattle the whole year, and one eight-foot silo thirty-two feet high will feed eight head until we have good pasture in northern Indiana, which is some time in May. A ten-foot or fourteen-foot silo with the same capacity will not feed the same number of cattle as long as the eight-foot silo, for you have to throw out too many cubic inches of silage in order to feed it off fast enough to keep the silage from spoiling.

I think the best plan is to build one small silo and if that does not answer put up more small silos. It's the length of the tube that counts, not the diameter.

Bremen, Ind. H. C. F.

⚜

I have two 8x24 silos, one is up three years and the silage came out as bright as when put in this winter. I have one about empty and have not had a handful spoiled. The other I put up last summer. If it would not keep in an 8-ft. silo I would not have spent $250 for the second one the same size.

Greensburg, Pa. J. E. W.

⚜

In 1915 I erected an 8x25 ft. silo and it has kept the silage perfectly every year. Have filled it with corn silage alone, corn and soy beans, and sorghum. All have kept equally well and I have fed as few as 5 cows up to middle of June and it was all good down to the last. Mine is a steel silo but I do not see any reason why one of any other material should not do just as well.

Bahama, N. C. H. L. U.

⚜

Silage will keep in a small diameter silo as well as in a larger one. At least it will here in Idaho where we have a dry climate with no rain from the middle of May until September first.

When feeding silage in summer have a heavy wet canvas and cover the silage when through feeding it. This will help to keep it moist and to hold its flavor and you will have no waste or dry silage.

Kuna, Idaho. I. A. K.

⚜

Two years ago I built a silo six feet inside diameter. As I have only two cows and a Shetland pony to feed I figured it was large enough. It works fine. I have as fine silage this winter as I ever saw. Of course a small diameter will allow freezing up here in the north. This winter I stacked straw for bedding around it and it has kept frost out entirely.

My advice would be to build as small silo as you want and it will work. More people build too large diameters than too small. In cold climates build silo in the barn or in the ground or surround it with straw.

Eagle River, Wisconsin. O. G.

Pasture Grasses

I have a field that is quite wet. Last year I cut alsike and timothy off it. Now I want to turn it into a permanent pasture. What in your opinion would be the best to do? I thought of seeding it to redtop before the frost went out. If that is a good plan, how much to the acre would you sow?

Lyons, Wisconsin. H. M. P.

In seeding the above piece of land down to a permanent pasture there are two procedures, either of which might be followed. According to the first one a mixture of about 10 lbs. of Kentucky blue grass, 10 lbs. of red top, and 2 lbs. to 4 lbs. of white clover should be seeded per acre before the frost is out of the ground this spring. This might be a good plan since the piece is already in timothy and alsike clover. If the field is very wet for any length of time, the redtop will be the predominating grass within a few years. If this plan is followed, either pasture this season or take it for hay again. The later might offer some advantages.

According to the second procedure, the field would be plowed and reseeded using a small grain as a nurse crop; a mixture consisting of timothy, 5 lbs. to 8 lbs; alsike clover, 4 lbs. to 6 lbs.; redtop, 10 lbs.; Kentucky blue grass, 10 lbs.; white clover, 2 lbs. Hay crops could be taken from this for at least a couple of years, during which time the slower growing grasses like blue grass and redtop would become established.

If this field is not drained, we would advise draining it. All grasses do much better on well drained soil.

Oil Meal vs. Cottonseed Meal

I understand that oil meal and cottonseed meal are about equal in feeding value when used in rations for dairy cows. A local feed dealer offers cottonseed meal in the cake considerably cheaper than oil meal.

Abilene, Kans. E. B. B.

Oil meal and cottonseed meal fill similar places in the cow's ration, both being high in their content of protein. A choice between them depends upon their market price and also upon the particular combinations of other feeds with which they are to be used.

Oil meal is somewhat laxative in a ration, while cottonseed meal has the opposite effect. Therefore in rations in which such feeds as alfalfa and silage are supplied in liberal amounts, cottonseed meal will very often give better results than using oil meal and combining the three laxative feeds.

In a test ration it is often wise to use both meals for the sake of variety and palatability. In the ordinary ration, in Kansas where alfalfa is fed liberally, cottonseed meal at the present price is a cheaper source of protein. In the general ration, therefore, we would favor this latter meal and would use oil meal rather as a conditioner than as a major source of protein. Cottonseed meal (41%) contains approximately one-fourth more protein per hundred pounds than does old process oil meal, but always note the analysis on the bag as the protein content varies and is sometimes even lower than oil meal.

Limestone on Alfalfa Sod

Is it practical to apply limestone on rye or alfalfa seeding with intentions of sweetening soil for alfalfa?

Eagle, Wis. W. H. J.

Ground limestone should be applied on the soil after it is plowed and prepared for seeding. If the alfalfa is already seeded with rye, the limestone may still be applied; but it is never advisable to apply the limestone and then plow it under. The reason for this is that the rains will tend to wash the limestone into the soil, and if it is plowed under the tendency will be to carry it into the subsoil instead of the top soil which is most likely to be acid.

When to Freshen Jerseys

Pease let me know at what age to breed Jersey heifers.

Sandy, Oregon. W. F. F.

Jersey heifers mature at an earlier age than some of the heavier breeds and therefore may safely be brought to milk production younger. It is recommended that well grown Jersey heifers may be bred to freshen at twenty-four to twenty-seven months.

Measuring Timothy

In estimating the amount of timothy hay in a mow, how many cubic feet is considered for a ton? For a section of this mow, 26 by 12, hay 6 ft. deep, how many tons would you consider a fair estimate?

Eau Claire, Wis. A. B.

A ton of timothy hay is usually calculated to occupy a space of 420 cubic feet. Figuring on this basis, the space specified contains approximately six and one-fifth tons.

Coming Events

Farmers' Grain Dealers' Association meets at Sedalia, Mo., March 16 and 17. Secretary, John Sheay, Columbia, Mo.

May 23—Missouri State Holstein Association first Annual Show of Sale Cattle at Sedalia, Mo.

Sings an unnamed lover of the farm: The country is a place to live in, as well as a place in which to earn a living. One-third of our people must be on the land and that third must love the land.

New Secretary of Agriculture

HENRY C. WALLACE

President Harding's appointment of Henry C. Wallace as Secretary of Agriculture is generally endorsed by farmers and farm organizations as a wise and gratifying selection. He is rural-minded, has a broad conception of farm affairs, and is well equipped mentally to fill the new position of trust to which he has been called.

Mr. Wallace is editor of Wallaces' Farmer, succeeding his father who was affectionately know as "Uncle Henry" to thousands of farm readers during the past quarter of a century. He knows personally, as well as editorially, of some of the trials and tribulations of a farmer and live stock breeder. Mr. Wallace was born at Rock Island, Ill., May 11, 1866. He was graduated from Iowa State College in 1891, was Professor of Dairying at that institution from 1892 to 1894, and finally joined his father in his farm newspaper enterprise. Mr. Wallace was married in 1887 to Carrie Brodhead, and they have six children: Henry A., John B., Annabelle J., James W., Mary O., and Ruth E.

The Feed and Hay Market

[Report by U. S. Bureau of Markets.]

The feed market during the week ending Feb. 19, presented few new features. Colder weather and snow in many sections stimulated confidence on the part of jobbers and resulted in mill offerings, especially those of wheat feeds, being more readily taken for speculative account. While southeastern, southwestern, and Pacific Coast markets were generally lower, middle western and northeastern markets reported an improved feeling among the jobbing trade. Conditions in Cincinnati and a few markets in northeastern territory continue dull, and the course of prices was downward.

Stocks in general are good because of light consumption and adequate production and it is doubtful whether the opening of the heavy feeding season could be entered under more favorable circumstances from a feeder's standpoint. Receipts at warehouses were good. One Buffalo warehouse reports the storing of 900 tons of bran during the past week, while stocks of beet pulp in that market increased to over 4,000 tons. Brewers grains, malt sprouts, and various other feedstuffs appear in plentiful supply. The situation in regard to supply and demand in consuming sections is practically unchanged. Supplies are generally heavy and in many sections much in excess of requirements and the outlook for an increased demand is not considered good.

While prices on wheat mill feeds in the middle western and northeastern markets advanced anywhere from 50c to $1.50, southeastern markets declined approximately to the same extent, because of large stocks. Middlings were in better request than they have been for some time. Little improvement in the demand for flour middlings and red dog was noted.

Mill prices on cottonseed cake and meal were firm but as stocks in dealers' hands continue large there was little interest shown in offerings, which were fairly liberal. Stocks of seed on hand at mills are about 7,000 tons larger than they were at this time last year, indicating continued good offerings particularly of the high protein content meal. Exports of cottonseed cake and meal during January 1921 were about 16,000 tons compared with 26,000 tons January 1920. Hulls are steady and prices unchanged.

Linseed Meal Prices Down

Minneapolis mills lowered their price on linseed meal to about $36.50 f. o. b. that market. The demand is fair but is still much smaller than during former years. Farmers and feeders are reported to be buying in small lots only, which condition appears to be general. In eastern territory, prices are stronger due to a better export demand and improved buying for local account. Stocks are good.

The yellow hominy feed is quoted in several markets $1.50 per ton less than white hominy feed, though it is quoted in the Chicago market on the same basis. The price was slightly easier because dealers are well stocked and the demand is confined principally to immediate shipment.

Business in beet pulp is stagnant and excessive stocks of both domestic and imported pulp, together with continued offerings from abroad and Canada, caused dealers to reduce their prices materially. The lowered quotations failed to bring any increased demand. Southern California and a few southeastern markets report a fair request. Philadelphia brokers quote $4 lower than last week.

Hay Market Weaker

With the exception of New York, prices on timothy were either unchanged or lower at the principal markets. Declines of $1 per ton at Philadelphia, $1.50 at Atlanta, $1 at Cincinnati, and 50c at Chicago and Minneapolis occurred during the week. At New York the heavy decline in prices during the previous week caused shippers to suffer heavy losses and shipments were curtailed to such an extent that prices were forced up about $3 from the low point.

The alfalfa market generally was also weaker because of a heavier movement with no improvement in the demand. Prices declined $1 to $2 per ton in several weeks. The increased receipts of alfalfa during the past two weeks have been caused chiefly by the movement of the western hay. Shippers in Montana, Idaho, Wyoming, and Colorado are anxious to move as much of their hay as possible before the last of April when the time for the application of the reduced rates will expire.

Considerable of the alfalfa being marketed is only of fair quality. This is causing a better demand for the choice hay but a very poor demand for the poor hay and heavy concessions must be made to move most of the low grade arrivals. Several cars of low grade hay are on track unsold, with demurrage accruing, at both Kansas City and St. Louis.

New York Butter Market

NEW YORK CITY, FEB. 22:—Developments of the last two weeks clearly indicate that a healthier condition would exist in all markets if values were reduced sufficiently to create an active demand. Since the holiday season there has been a gradual decline in the quotations of butter. While the decline was slow at the outset, it reached a climax during the second week in February when the quotation on extras reached the low mark of 42½@43c. When that low price was reached, consumers immediately began to purchase butter freely and have continued to do so with the result that practically all the accumulated supplies of all grades of fresh butter were cleared, leaving the market with scarcely enough available supply to satisfy demand. The condition of the market at the present time is the best that it has been for several months. Pessimism has vanished and there is a marked eagerness on the part of buyers to lay in sufficient supplies to last them for several days. For some time hand to mouth buying has prevailed, and it is now highly pleasing to receivers to deal with less critical buyers.

One factor that is having a decided influence on the market at present is the chain store trade. Chain stores are keeping their retail prices in line with wholesale prices with the result that their trade in butter is enormous. As their storage stocks are becoming depleted they are very active buyers on the open market which is resulting

(Continued on page 276)

Cheese Prices Steady

[Report by U. S. Bureau of Markets.]

Cheese markets show further recovery from the temporary dullness which featured the early part of the month, and trading during the week ending February 19 was fairly active with the tone of the markets steady to firm, especially on the larger styles. Local business was slow in some quarters, but on the whole the situation was improved over recent weeks. At primary markets in Wisconsin, all styles moved fairly well, although early in the week it did not appear that this would be the case.

Supply and demand for a few styles have been irregular for some time with the result that price changes have in some cases shown more of a fluctuation than general market conditions would indicate. On February 14, prices resulting from trading on the Plymouth, Wisconsin, Cheese Exchange showed both declines and advances. Longhorns and Young Americas lost a cent or more, while white Daisies supported by active demand advanced ¼ to ½c. Wisconsin dealers report that the present demand for Daisies and Twins is heavy so that even though little immediate change is anticipated in prices, it would not be surprising to see these styles show advances.

Light Supply of Fancy Held Cheese

The market on held cheese remains steady. Except for the fact that stocks do not represent a surplus, especially on finer grades, held cheese prices might now be showing signs of slipping. However, there is still sufficient outlet, mostly in a small way, for held goods of quality to cause dealers to hold to top prices. More trade is turning to fresh cheese, possibly due in part to this. Held undergrades are not moving so satisfactorily as dealers desire. Domestic demand for this class of goods is light, and the export situation is such that movement is very slow.

The average wholesale prices on American cheese (style Twins) for the week ending Feb. 19, 1921, and for the corresponding week last year, were as follows:

	Week ending Feb. 19 1921	1920
	Cents	Cents
New York	27.7	29.1
Chicago	24.7	28.4
Boston	24.7	31.5
San Francisco	22.5	27.3
Wisconsin	24.6	28.4

The total receipts of American cheese at these markets were 2,701,725 lbs., as compared with 2,100,447 lbs. last year and 2,523,873 lbs. last week.

Activity Features Week's Butter Markets

[Report by U. S. Bureau of Markets.]

The strong rally which started the previous week on the butter markets continued throughout the week ending February 19. Unlike other firm spots of recent weeks, advances were not followed by reactions. Trade continued exceptionally good all week, and most of the buying was on fresh butter. New arrivals and held over stocks were well cleaned up. Toward the latter part of the week an actual shortage developed, and this together with the difference in price between storage and fresh turned a number of buyers back to storage. Storage prices on the best centralized cars advanced very rapidly the latter part of the week. Storage creamery did not share in the price advance but did begin to find some outlet, preference being for long lines.

The quick turn of the markets toward higher prices is as hard to account for as it was unexpected. Probably the low prices which followed the extended decline restored the confidence of buyers and it is certain that stocks of butter in the hands of jobbers and retailers had reached a low point. Danish butter at New York cost too much to compete on the market and the Danish market had also advanced making current offerings for future shipment cost up to 43½c C. I. F.

The markets all closed firm. It is likely that the shift to storage butter will ease up the demand for fresh and this together with the expected cargo of Danish at New York, may shortly take the edge from the market. However, there is no evidence of this as yet. Noticeable features of the market are that the range of prices between top and low scores is narrower than it has been for sometime, and that the Chicago market has continued to quote prices nearly on a parity with eastern markets.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending Feb. 19, 1921, and corresponding week last year, were as follows:

	Week ending Feb. 19 1921	1920
	Cents	Cents
New York	46.8	67.2
Chicago	46.2	64.3
Philadelphia	47.5	68.0
Boston	46.7	66.0
San Francisco	48.9	62.2

The receipts of butter at these markets were 6,944,624 lbs. as compared with 5,220,763 lbs. last year and 6,901,382 lbs. last week.

Wisconsin Jersey Breeders

The Wisconsin Jersey Breeders' Association held their annual meeting at Madison on February 11th. In order to give greater publicity to the Jersey cow, it was decided to collect an assessment of a dollar per cow from all owners of pure-bred cows—this sum to be used in Jersey publicity and in the support of a fieldman, possibly in co-operation with the states of Minnesota, Iowa, and North Dakota.

It was also decided to hold an annual state sale at Madison on the first Thursday in May, this to take the place of the summer meetings that have been heretofore held. The executive committee is to act as the sales committee in managing the sale and selecting the cattle.

The following officers were elected: Charles Peterson, president; M. Stafslien, vice-president; G. W. Vergeront, Onalaska, secretary-treasurer.

$200,000 Saved for Farmers

According to Richard Hall, manager of the Grange League Federation Exchange of New York, a gross business of $1,369,349.20 was conducted by the Exchange in 1920. Mr. Hall estimates that a direct saving of over $200,000 was made to the farmers who purchased supplies through the organization, as well as the large saving brought about because prices in other markets were lowered through the influence of the Exchange.

You can't buy a cheaper feed than Larro

You may find a ration that costs less—but not one which produces bigger profits.

Thousands of successful dairymen are feeding Larro every day for just one reason—because in the long run it's the cheapest feed they can buy.

You may save one, two, or three cents daily on a cow's feed with a low priced ration.

Or you may get one, two, or three quarts more milk every day with Larro.

Which pays best?

May we send you names of dairymen in your own community who are *making more money* by feeding Larro?

The Larrowe Milling Company

The Ready Ration For Dairy Cows

Can Home Grown Rations Maintain Milk Production?

(Continued from page 260)

into a negative nitrogen balance, as the chemist expresses the situation where the protein supply is insufficient to meet the requirements for milk flow and body maintenance. They remained in this condition until the milk flow had decreased to a point where the demands upon the ration for milk production enabled the body to regain its nitrogen equilibrium.

What the Results Indicate

The results of feeding the clover hay, corn silage, and cereal grain ration show that such rations do not furnish dairy cows a sufficient amount of the right kind of nutrients to properly maintain their bodies and produce a high milk flow. On such rations, cows will naturally adapt themselves to the ration in a manner to secure proper body maintenance, and reduce their milk flow to a point consistent with the nutrients supplied in the ration.

In view of the fact that the cows were fed practically as much of the rations as they would consume and that they immediately went into a negative nitrogen balance while making the higher productions of milk, it is clearly evident that the protein mixture was insufficient. The conclusion to be drawn is that while a ration of clover hay, corn silage, and cereal grain meets the requirements for a flow of milk not exceeding 20 to 25 pounds, the quality or quantity of protein would have to be materially changed if a higher production of milk were to be secured for any extended period of time.

Rations with Alfalfa Hay

A year after the period of feeding rations including clover hay, a similar trial under practically the same conditions was made in which alfalfa hay was substituted for clover hay. The very great prominence given to alfalfa on the basis of the relatively high protein content led to the belief that as a home grown product it might offer the opportunity to supply a protein mixture that would enable a home grown ration to meet all of the requirements for proper maintenance and high milk flow. The rations in this second trial included alfalfa hay, corn silage, and cereal grains. The grains used were corn, oats, and barley, respectively, and a mixture of the three. These rations were fed over four consecutive periods of four weeks. The plan was to use only three animals for the entire period, but No. 3 cow went off feed at the end of the first four weeks and a fourth cow was substituted. With this substitution the plan was successfully carried through to the end of the period. As in the former trial with clover hay, records of feed consumption, milk and butterfat production, and the nitrogen intake and outgo were secured in order to show the final results.

The alfalfa hay was taken from a car lot bought by the University from a western market subject to the classification and grade "choice pea-green hay". As a matter of convenience in feeding and overcoming any waste, the hay was cut before feeding by an ordinary feed cutter. The grains were ground and with each ration a small amount of corn starch was fed to insure a constant and ample supply of energy-producing nutrients.

How Clover and Alfalfa Rations Differed in Composition

Air-dried samples of all the feeds were carefully analyzed in both feed-

Increase the Value of Your Farm With a Silo

Get the beauty and durability of tile in the Lansing **"ship-lap" block.** Ends overlap — extended shoulders top and bottom—less mortar exposed, better settling of silage—less chance for frost, better looking silo, blocks uniform in shade. Stronger walls. Notched ends on blocks prevent mortar from slipping. Twisted steel reinforcing. Steel hip roof—steel or tile chute—fire proof. Write for Catalog.

ing trials to get a check on the nitrogen intake of the cows daily. The intake of nitrogen was necessary in order to get a comparison with the outgo of nitrogen which was secured by taking into consideration the analysis made of the excreta and milk, and thus know what was taking place as regards proper maintenance or a nitrogen balance on the part of the cow. From the analyses made of the feeds, there was a slightly higher per cent of nitrogen in all of the feeds of the rations used in 1918-19. This was undoubtedly due to a somewhat more favorable growing season for the production of nitrogen in the feeds concerned. This general difference in the nitrogen content of the respective feeds, however, was very slight compared with the principal difference there was in the per cent of nitrogen in the clover and the alfalfa hay. The per cent of nitrogen in the clover hay fed in 1918-19 was 1.74, and in the alfalfa hay fed in 1919-20 was 2.48. From the result secured it appeared that a unit of nitrogen in one ration was equal to a similar unit in the other, and that the difference was primarily in the higher nitrogen intake made possible by the higher nitrogen content of the alfalfa hay. In terms of total crude protein, 50 pounds of the ration with clover hay contained 2.86 pounds of crude protein and 50 pounds of the ration with alfalfa hay contained 3.44 pounds of crude protein.

From the data and records secured, about 60 per cent of the total crude protein was digested and therefore in terms of digestible crude protein the amount of crude protein utilized by the cows on the clover hay ration was 1.72 pounds and the amount of crude protein utilized by the cows on the alfalfa ration was 2.06 pounds.

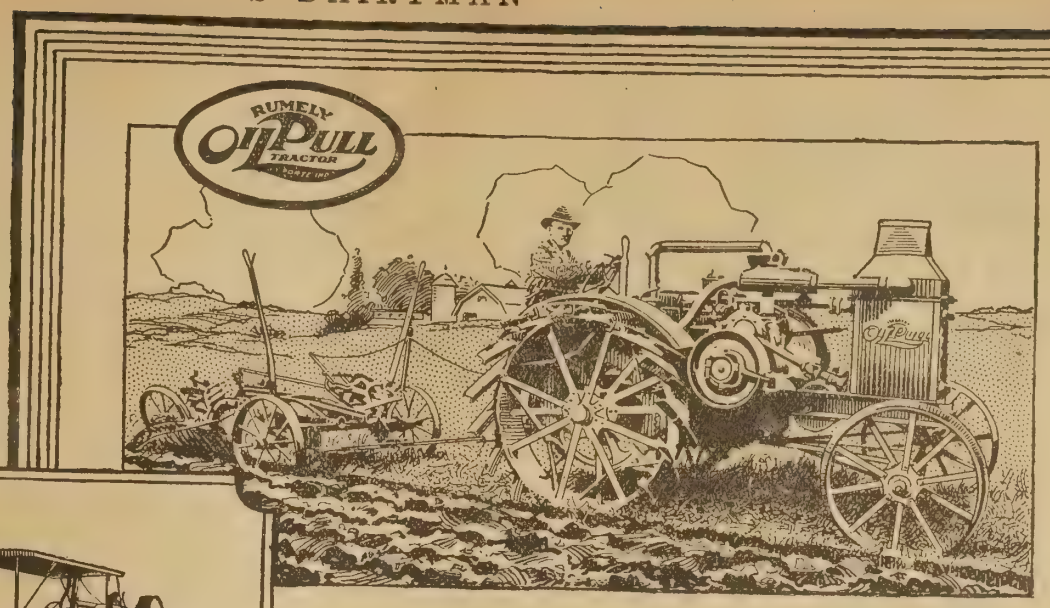
Results of Feeding Alfalfa Hay Ration, and Conclusions

In feeding the alfalfa hay rations, it was found possible not only to maintain nitrogen equilibrium with cows milking 40 to 45 pounds of milk daily, but to maintain practically that flow over the period of 16 weeks. The milk of the cows, both in composition and flow, was well maintained. The only shrinkage in amount was apparently that incident to progress in the lactation period.

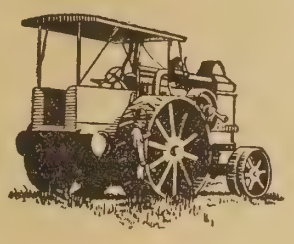
The results of the two trials would indicate that alfalfa hay has a superior value over clover hay, and makes it possible to use a home grown ration for maintaining comparatively high milk flow over a period of at least 16 weeks. The greater value of the alfalfa would appear to be in the greater amount and possibly better quality of protein it provides.

The results of the two trials furthermore indicate that it is unprofitable not to supply protein in quantities or of a quality that is sufficient to maintain nitrogen equilibrium and a flow of milk consistent with the productive capacity of the cow.

The ration including alfalfa hay had a nutritive ratio of 1:7.9 and provided a satisfactory ration with a less amount of digestible true protein than is specified in the requirements of the Armsby Feeding Standard, and also somewhat less digestible crude protein than is specified by the modified feeding standards suggested by Henry and Morrison. It should be taken into consideration that these trials cover periods of only 16 weeks. Longer observations should be made to decide whether rations including alfalfa hay similar to those fed in the second trial of this investigation would be adequate for an entire lactation period. Investigations under conditions pertaining to ordinary dairy practices will be made before definite and final conclusions are made with reference to what the possibilities are of utilizing strictly home grown rations for the maintenance of high milk production throughout entire lactation periods.



[Editor's Note:—This article was prepared for Hoard's Dairyman by Professor Humphrey because our recent mention of the Wisconsin experiments occasioned so many calls that the available reprints of the original article were exhausted. We are substituting this for the conclusion to his address before the 48th annual meeting, the first half of which appeared in our issue for last week, as it includes the experimental feeding with alfalfa as well as with clover.]



Jersey Cattle Notes

For week ending Feb. 11:

Number of animals registered: Bulls, 234; cows, 540; total, 774. Number of transfers recorded: Bulls, 233; cows, 516; total, 749.

A manure spreader saves time, labor and manure values, especially if the manure is hauled and spread as it is produced.

Let H. L. Miller, Cannon Falls, Minn., express to you his opinion of the OilPull tractor based on an experience of 8 years. He says:

"After eight years of hard plowing, threshing and road work, my OilPull is in such good shape that I would not trade it 'even up' today for a new tractor of any other make. It always has more power than I need, even on the toughest jobs. It has given no trouble and I am positive it will easily last 15 years more."

To its tremendous and never-failing power can be attributed much of the OilPull's unequaled performance and long life.

How much Power do You Demand in a Tractor?

THE investment you make in a tractor is chiefly to secure increased power on your farm. The power to plow more and deeper and faster—the power to operate your own thresher, sheller, silo filler, etc.—the power that saves your horses, relieves your help, speeds up the whole program of farm work—power that decreases production costs and increases farm profits.

And it is the great power and great reserve of power that enables the OilPull to do all ordinary farming jobs with ease and constant dependability and, in addition, to be fully equal to the extraordinary jobs—to work over hills, to operate steadily in toughest sod, to thresh tough, wet grain.

Indeed, it is largely its power—its ability to perform the hard jobs easily—that accounts for the unequaled length of life for which the OilPull is famous.

To all this is added an unequaled record of economy that makes the OilPull cheapest in cost per year of service, despite the mere selling price of any tractor. It is guaranteed to burn kerosene under all conditions. It is oil cooled. Two distinct lubricating systems—mechanical and splash—operating simultaneously, insure positive lubrication.

The Advance-Rumely dealer in your locality will be glad to supply all the information you desire about these or other features of the four sizes of the Rumely OilPull tractors, or about the five sizes of Rumely Ideal threshers. See him or write us.

What Father Thought An *Expense* Son Makes An *Investment*

A MIDDLE WESTERN FARMER tills the same acreage that he, his brother and father used to farm. And he makes *more* money.

His father used the implements others threw away—unknown makes—for which repairs were hard to get or unobtainable. To him, farm implements were an expense—one to keep small. The son buys *known* tools—the best. He believes that implements to a great extent determine his profits—that implements are an *investment.*

This year farm profits will depend largely on production costs—hence on implements. Before investing, the careful farmer will ask: "Does the tool mean better, faster work—is it dependable and durable?" Sixty-eight years' experience has served to answer these questions correctly in E-B line of farm tools. In these, your investment is protected. Every E-B tool is made to work when needed, to last many years, to lower production costs — facts attested to by farmers everywhere.

Close study of the farmer's needs has taught us *what* to make—sixty-eight years' experience has taught us *how* to make it.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, Feb. 23—With pressure at high tension to pass necessary appropriation bills, clean the slate of what the leaders call "essential legislation", and get the decks cleared for the new administration, matters of special interest to the dairy industry are not numerous in the national capital this week. The most interest is in the emergency tariff bill, which carries the hardly won dairy schedules and which still has a fighting chance to pass but still less to become law by the President's signature.

The Senate added so many amendments to the bill, that when it came back to the House a vigorous fight was made against even sending it to conference. The attack did not concern dairy schedules in particular, but came from two sources, old line Democrats who began to object seriously to the bill for its antagonism to the revenue tariff principles of that party, and Republicans from industrial sections who claimed that the bill would increase the cost of living and thus increase the difficulty faced by manufacturers in bringing down the labor costs of production of manufactured goods.

The fight lasted nearly all day in the House, where the Rules Committee had offered a rule to send the bill directly to conference, but finally by a vote of 192 to 133 the rule was adopted and the bill has gone to conference. The debate indicates something of the breaking up of party lines, and the attack that an agricultural tariff must face in the coming Congress. The latest news is that the tariff on butter was reduced to six cents, but the other dairy schedules had not been changed.

⚜

The Senate and House conferees are still deadlocked on the Capper-Volstead collective bargaining bill. The chances for any action are exceedingly slim.

⚜

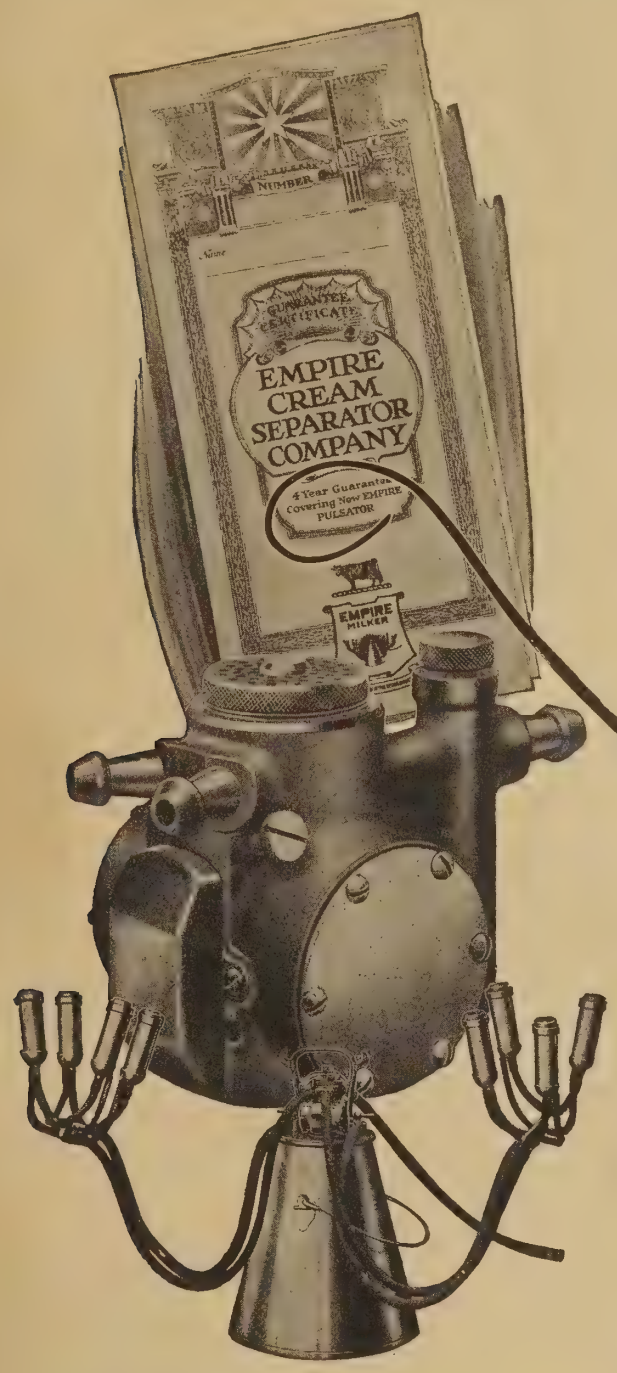
The Banking and Currency Committee, investigating the farmer organizations, held a session on Tuesday and will hold one more on March 1, closing the investigation. On Tuesday last Dr. A. C. True was the principal witness. He told of the activities of the county agents in organizing farm bureaus, stating that this was in pursuance of what the agents found to be their necessities, as they needed organizations of farmers to co-operate with them in their agricultural extension work. They found it unwise, he said, to work with any secret organizations or with commodity organizations, as they needed an organization in which farmers generally were members. He said that the work of organizing farm bureaus was not being actively carried on by county agents at this time, as the American Farm Bureau Federation had its own organizers at work. Representative Wingo of Arkansas questioned Dr. True closely and asked him if he did not find much jealousy from farm organizations already existing. Dr. True admitted that this was true. George P. Hampton followed Dr. True on the stand, and told the committee of the sources of the financial support of the Farmers' National Council. He named three organizations that contributed: the Washington State Grange which paid $900 last year, the Gleaners' Federation which paid $300, and the Michigan Potato Growers' Association which paid $200. The total receipts were about sixteen thousand dollars. Two individuals, E. C. Laseter of Texas and W. L. Kent of California contributed about $7,500. The Plumb Plan league paid in about two thousand dollars and the All-American Co-operative Association more than a thousand dollars. His statement indicated very clearly that no big national farmers' organization except the Gleaners were affiliated with this so-called Farmers' Organization. At the final hearing on March 1, J. R. Howard of the A. F. B. F., and C. B. Smith and W. A. Lloyd of the Department of Argiculture will be witnesses.

⚜

The resolution authorizing the President to invite foreign delegates for a World Dairy Congress in the U. S. next year is on the unanimous consent calendar in the House, but will get more expeditious action in the Senate, where it is to be added to the agricultural appropriation bill as a committee amendment, thanks to the active interest in the project of Senator A. J. Gronna of North Dakota. This appropriation bill was temporarily sidetracked this week to make way for the railroad bill, but will be the next big bill considered.

New York Butter Market

(Continued from page 272)



in a sharp clearing up of all available butter supplies in wholesale stores. In addition, out-of-town buyers are here in considerable numbers and are purchasing in large quantities. Receivers would have welcomed the present conditions during January as they were well stocked with large quantities of butter which had been taken to account at comparatively high prices. While those supplies are now absorbed, the holders of them have lost large sums of money.

Except for the arrival of the steamer, United States, on Thursday of last week, with a cargo of 7,940 casks and 100 boxes of Danish butter, there is little of that stock available. Another shipment of about 1,800 casks is expected to arrive today. For the first time in several months, the arrival of foreign butter is welcomed as it will help in a small way to supply the present strong demand. No other Danish butter is on the water at present, nor will there be any shipments for some time as Danish agents are now soliciting orders for the next shipments. The asking prices are 42@43 (c. i. f.), an advance of from four to six cents over the asking prices of two weeks ago. The selling prices of fresh Danish butter are now about 47@48c.

On Monday of last week, the quotation on extras advanced 1c, making the price for that day 45c. On each succeeding day of that week there was a similar advance with the exceptions of Thursday and Saturday, the quotation at the close on Saturday being 48c. Yesterday, there was a further advance of 1c and, as today is a holiday, Monday's quotations are unchanged. They are: Extras (92 score), 49c; higher scoring than extras (93 score or higher), 49½@50c; firsts (90—91 score), 46@48c; firsts (88—89 score), 43@45c; and seconds (83—87 score), 35@42c.

W. B. LIVERANCE.

At Last: A Pulsator with a 4-Year Guarantee

FOR years the Empire has set the pace in the milking machine field—and now it will assume a stronger position than ever before. This Pulsator is the result of our constant endeavor to "better the best."

Even with our years of experience, the best engineering talent obtainable and every possible facility for perfection of design and manufacturing, it has never before been possible to produce a Pulsator which could be guaranteed to maintain absolutely satisfactory service for a period of years. Now, however, by combining a number of well-tried engineering principles Empire has produced a Pulsator in which we have such boundless faith that we are backing it by an unqualified 4-year guarantee.

EMPIRE PULSATOR

Look at the illustration. The Pulsator is simple and self-contained—fool-proof and easy to adjust. All parts are easy to get at. It can be removed from the lid in a second. It is sanitary to the last degree. No slop or oil can get into the milk. Nor can any milk get into the Pulsator.

The fact that we are issuing a 4-year guarantee means more to any dairyman than the most detailed explanation of how the Pulsator works. And, remember that the guarantee of the Empire Cream Separator Company is as good as a bond.

The Empire Milking Machine with the new Pulsator is your opportunity to get increased milk production and reduce operating costs. Write for catalog 1-M.

This Sale Includes the Dispersal of Two of the Best Small Herds in the State

FLETCHER BROTHERS HERD

Is One of the Greatest Small Herds in Wisconsin

It also shows what can be done with a foundation of 3 cows and a lot of hard work in a few years' time, by men who know how.

In this herd of 55 head, every animal has been raised and developed by Fletcher Bros. They can show from 4 to 6 generations from the foundation animals. Every animal of milking age has an A. R. O. record. The herd passed a clean T. B. test in January and will be tested again before the sale. A 60-day guarantee is given.

They have developed a 32-lb. cow who has twice made over 30 lbs. Their consignment includes her 26-lb. 2-year-old daughter.

They will sell their senior herd sire, Joe Oak De Kol Fobes, and 25 of his sons and daughters. He is a 29-lb. son of Fobes Tritoma Mutual D. K. Joe is a handsome individual and his sons and daughters are like him. He has 20 A. R. O. daughters and many more to be tested.

Also the junior herd sire sired by "Joe" and out of Korn. Queen Mutual Segis, 26.08-lb. 2-year-old. She made this record at 2 years and 7 months. This bull and his full brother will be sold. The dam is now on test and has just made 31 lbs. and still gaining. 3 sons in sale.

HER'S SENIOR HERD SIRE, A
R. DE KOL. HE AND 20 OF
WILL BE SOLD

Among the females is Nelson Segis Pontiac that made at 3 years, 586 lbs. milk, 30.14 lbs. butter. With her will be sold her 2-year-old daughter due to freshen, also her yearling daughter.

A 23-lb., 20-lb., and a 16-lb. daughter of the first herd sire, Sir Rose De Kol Korndyke, will be sold.

The second herd sire was King Colantha Korndyke Segis, a son of Johanna McKinley Segis. Seven of his daughters will be sold. Five of them have records over 20 lbs., the best one 26 lbs.

Joe Oak De Kol Fobes, the senior herd sire, was the next sire and of the 20 daughters of this bull to be sold, seven have A. R. O. records, including a 26.21-lb. junior 3-year-old and two 19-lb. junior 2-year-olds.

King Segis Johanna Parthenea, a grandson of "Count", was also used. His 4 nearest dams average 1,000 lbs. of butter in 365 days. Three of his 2-year-old daughters and 4 of his sons ready for service, will be sold. One of them is from a 26-lb. 3-year-old. You will find them exceptionally good individuals.

We lack space to tell of the good things to be offered in this herd. Come and see them, and you will want to own them.

Power Farming Is a Profitable Investment

Nearly two hundred thousand farmers bought tractors last year. This emphatic endorsement of Power Farming shows that it has proved its worth as a sound economic farm investment. Power on the farm protects your capital in land, your present investment in labor, and pays a larger dividend on all of them.

If your farm is power-equipped you will have an added advantage this year. You will grow larger and better crops at lower cost. You will make a profit regardless of the market price *because your decreased cost will have widened the margin of profit.*

The Samson Model "M" is just the tractor you need for this purpose. You can depend upon it to do your work right. It is a tractor with carefully distributed weight and pulling power ideally suited to the average farmer's power requirements.

It is an economical power unit that is easy to operate and use the year round, not only for drawbar but for belt work as well. In tilling, planting, harvesting and threshing of your crops the Samson will deliver unfailing power at the time you need it most

Write for information on Samson Power Farming and its value to you. Learn how much you can save in time, labor and money on your farm.

Dr. Stattler's
STOP SCOUR

STOP YOUR GREATEST PIG, CALF AND COLT LOSSES

THERE isn't a man raising live stock who hasn't had big losses from Scours in pigs, calves, and colts. Now is the time to insure yourself against this greatest of the breeder's losses.

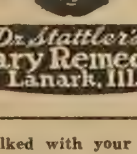
STOP SCOUR is not an experiment. It is not a theoretical formula prepared in an office for commercial purposes, but is the result of my many years actual practice of veterinary medicine.

INSURE THE COMING CROP

Give DR. STATTLER'S STOP SCOUR to your pregnant dams. Then give it to the offspring after it is born. Small doses will prevent Scours.

STOP SCOUR WILL CURE ANY CASE OF SCOURS WITHIN 12 TO 48 HOURS

STOP SCOUR is an absolute cure. If your pigs, or calves or colts are actually scouring, DR. STATTLER'S STOP SCOUR will cure the worst case. I have never lost a single case from Scours in my private practice.



STARVATION NOT NECESSARY

With DR. STATTLER'S STOP SCOUR, you don't have to reduce the ration. Feed just as usual.

DR. STATTLER'S STOP SCOUR is carried by your druggist or feed dealer. If he shouldn't have it, write us his name and address, and we'll see that you get it either through him or direct from us.

A POSITIVE GUARANTEE

STOP SCOUR is sold under a positive guarantee and the fulfilling of the guarantee is placed in the hands of the Exchange State Bank of Lanark, who agree to refund your money without question if you are not satisfied. You are doing business with an institution of known reliability.

Larson Presents Butter Statistics to Michiganders

"The United States is the greatest butter country in the world." C. W. Larson of the Dairy Division made this statement before the buttermakers at the recent meeting of the Allied Dairy Interests of Michigan at Grand Rapids in a most informing address on the present butter situation.

Mr. Larson ranked Russia second in the quantity of butter made, one-half of the output being exported; France third with a very small amount exported; Denmark fourth and exporting the greater part of her output; and Australia and Canada fifth and sixth with only a small percentage for export. He showed that the increase in butter manufactured in the United States during the past ten years has been slight, the total in 1920 being about 1,500,000,000 lbs., that the quantity of cheese is about the same as in 1910, and that the output of condensed milk has increased three hundred per cent. According to his data more milk is now being condensed than is going into cheese, and the manufacture of butter takes more milk than both cheese and condensed milk.

World Butter Shortage

There is less butter in the world than at any previous time in fifty years, said Mr. Larson. While the United States has maintained its creamery output, many other countries have netted decided reductions. This country exported slightly more butter in 1913 than was imported; in 1914 the reduction in tariff resulted in a small net import; and since that year the net imports have been substantially increased, the total import in 1920 being 37,454,000 lbs. Of this, 19,937,000 lbs. came from Denmark, 9,235,000 lbs. from Canada, 4,048,000 lbs. from Argentine, 3,061,000 lbs. from the Netherlands, and lesser quantities from other countries, including France, Norway, Sweden, New Zealand, European Turkey, and Germany.

The 1914 importations of cheese were large. From the beginning of the war exports exceeded imports, increasing until 1917, since when they have declined until 1920 when they were only about equal to the quantity brought in.

Imports and exports of condensed milk were about balanced at the opening of the war. Then came enormously increased exports which continued until 1920 when the number of cases sent out was cut in half. From the beginning of 1918 to June, 1919, the rate of export increased 400% and then declined to barely one-seventh of that rate by the end of 1920. Mr. Larson drew his hearers' attention to the fact that during the months of this marked decline, when exports represented fifty per cent of the output, production was not reduced.

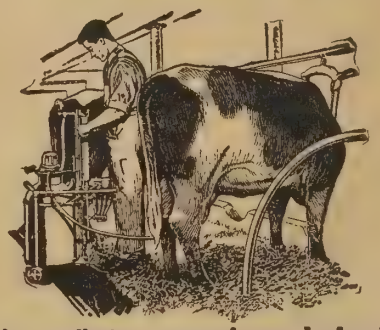
World's Trade in Butter

The world's total export of butter in 1913, says Mr. Larson, was 700,000,000 lbs. Of this amount the United Kingdom imported 64.4 per cent and Germany, 17 per cent. Denmark exported 27.9 per cent of the total; Russia, 23.8 per cent; Netherlands 11.3 per cent; Australia, 10.6 per cent; and Sweden, 6.5 per cent. In 1919 the world's export butter business was 54 per cent less than in 1913, and the two largest buyers, the United Kingdom and Germany, took much less than half as much as they purchased in the year preceding the war. Not only is the world producing much less butter than before the war, but, by Mr. Larson's statistics, there is a marked underconsumption the world over, as compared to 1913. The

Don't Send 1 Penny

Just send us your name and address —no money—and I will send these stylish leather oxfords and silk hose to you. You don't pay one penny until they are delivered by postman. Oxfords are worth more than $2.98, so you are getting the silk hose free. **Delivery Free**

Ladies' OXFORDS and SILK HOSE



Oxfords are made of strong leather, which will give excellent wear. Have flexible leather sole and sensible Cuban heel. Very stylish. **Colors: Dark brown or black.** Sizes: 2½ to 8. Widths: D and E. The hose are made of fibre silk with double high spliced heel, sole and toe. Upper part is made of cotton with double garter band. Seamless. **Colors: Brown or black.** Sizes: 8½ to 10. One pair of hose with each pair of shoes. Order the shoes as pictured above by No. 60. **$2.98**

High Heel Oxford. If you want a pair of the same shoes as described above, only with high Louis heel as pictured at side, with one pair of hose free, order by No. 61. Give size and color.

Send Now just your name and address —no money When the shoes and hose arrive, pay the postman **$2.98** for them. We have paid the delivery charges. If you don't find them all you expected, send them back and we will cheerfully refund your money at once. Could anything be fairer?

WALTER FIELD CO., Dept. D-1199, Chicago

Complete MILKER $123!

No installation expense!—run by hand

AT LAST! A milker for *every* farmer—whether he has few cows or many! The Page *Hand Operated* Milker—only $123. One-fourth the work of milking by hand. So simple, a child can run it. Like hand milking—adjustable to any cow. Send coupon below. Find out how to end milking drudgery and solve your labor problem.

For Small or Large Herds

The man with 6 to 16 cows can use this model, never needing a power driven milker. The man with a larger herd can use it to try out machine milking in a small, inexpensive way and **change later to our engine or electric power model.** Hand Power model accepted in trade at almost full purchase price.

The Page, in any model, is simple—has fewer parts—therefore—*costs less.* Scientific, practical, easy to operate sanitary.

On Trial!

Learn how we stand back of our machine with an absolute iron clad guarantee that it *must* do the work if operated according to instructions. Try the Page Hand Power Milker on your herd and see, if after thirty days, you are not delighted with the results. 90 days to pay. *Just find out for yourself. Write for our offer.*

Send Coupon for FREE BOOK!

Let us send you our free catalog. It's full of important facts—an education in milking machines. Learn how to get the greatest milking service at the lowest cost. Learn also how you are completely protected in giving our hand power machine a trial on your own herd. Send the coupon today.

THE BURTON PAGE CO., Dept 4623
661 West Lake Street, Chicago, Ill.

Please send me your free booklet containing the facts on milking machines and full details of your direct offer on the Page Hand Operated Milker.

decrease of butter consumption in England of 200,000,000 pounds per year is six times the 1920 importations to the United States. Food control provisions there limit the per capita use of butter to one to one and a half ounces per week. It also fixes the price. March 31 1921, this control ceases and a marked increase in demand for butter is expected. Mr. Larson ventured no prediction concerning probable export increases to Germany, normally the world's second largest butter customer.

Butter Substitutes

In 1894 the United States consumed 70,000,000 lbs. of oleomargarine. By 1902 the yearly quantity consumed was 126,000,000. The tax put into operation that year kept down the increase so that it was only 140,000,000 in 1910. From that year the increase has been great, Mr. Larson's figures putting the total for 1919 at 350,000,000 lbs. and the 1920 estimate even larger.

Mr. Larson indicated the great need of agents in foreign countries to furnish the markets of the United States with information on foreign butter production. He showed that imports have depressed prices far more than their quantity justified because of the uncertainties of foreign conditions.

The need for improved quality in domestic butter was proved by prices quoted from markets where the imported product outsells much of it. Mr. Larson gave this as one of the important price factors demanding the buttermakers' immediate attention.

Discussing the influence of foreign exchange in butter importations to this country, data was presented showing that a tax as large as in the proposed emergency tariff would still have netted Danish exporters a profit throughout 1920.

PROTECT YOUR TIRES AND GET 20,000 MILES SERVICE

We positively guarantee that tires cannot cut, bruise, overheat. Ordinary punctures impossible. Prevent blow-outs. Cannot wear out in 20,000 miles on all kinds of roads when covered with

MULE-HIDE Four-Unit Asphalt Shingles
Easier to lay; made in red or grey-green slate surfaces. Size 10x32 inches; 112 strips to the square.

MULE-HIDE Shingle-Craft Roll Roofing

Especially recommended for use over old wooden shingle roofs. Made in the Cut Shingle design and the Square Butt, as indicated. The designs are embossed in black over surfaces of unfading red or grey-green slate.

Both designs may be purchased in either color, and in the Vertical or Horizontal style. The Vertical style is made especially for covering old wooden shingle roofs.

MULE-HIDE Slate-Kote Roll Roofing

Contains the same extra strength and wearing qualities as MULE-HIDE Smooth Finish Roll Roofing with the added advantage of its slate surface. In red or grey-green; Heavy, weight 90 lbs. per square; Extra Heavy, weight 115 lbs.

MULE-HIDE Smooth Finish Roll Roofing

Makes good, tight roofs for farm buildings, dwellings, industrial buildings—in fact, any building with a sloping roof. May be purchased in three different weights—Extra Heavy, 60 lbs. per square; Heavy, 50 lbs.; Medium, 40 lbs. Directions for applying, together with Nails and Cement, are packed in each roll of MULE-HIDE Roofing.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

The Story of My Pig

HOARD'S DAIRYMAN JUNIORS:—In school, we have an agricultural department and all who take this work must perform some project during the summer. So I decided to raise a pig. I had heard that one pig alone would not do well so I took two. Many farmers have said that there is no money in raising hogs or there is no money in buying feed for them. I thought this would be a good chance to find out if these statements were true.

I took two little pigs of my father's, weighed them and then penned them up alone. I named the one I am writing about Charlie because often when he was out in the pasture he would start pulling a weed and then he would dance about almost like Charlie Chaplin in some of his funny shows. I selected a Duroc because we have this breed.

Green grass is important in raising hogs because it acts as a filler in the stomach when concentrates are being fed and it also acts as a laxative, a thing which all hogs need when being fed heavily. Pure water also serves as a laxative. At first my pig drank about eight quarts daily and at the close of the period he drank almost sixteen. When I weighed him, he was driven into a crate and both were weighed together and then the crate was weighed separately.

I mixed the swill and measured the corn and each was fed separately. He always drank the swill first and then he would eat the corn. I fed him morning, noon, and night right after my own meal. At first he got quite a little skimmilk, some oil meal, tankage, grist, and corn. The grist was made up of one-fifth ground corn, one-fifth ground barley, and three-fifth ground oats. I slowly decreased the milk and increased the corn until about the middle of July. Then I slowly quit feeding corn but kept on feeding some milk. When I quit feeding corn, I also stopped feeding oil meal and tankage. I then only fed him swill made of a small quantity of milk, plenty of grist, and water. I used to spend some time watching him eat and in scratching him. He became so tame that he would follow me about the pasture or any other place. My father also enjoyed petting him. My teacher occasionally visited me and gave me some advice and a few facts I obtained from my father. The rest I got out of our text book, "Feeds and Feeding". One day I spent at the county fair and I saw a full blooded pig that weighed 250 lbs. and he was only six months old. While there I learned that pigs should have somewhat long legs, large bones, and arched backs to make good show pigs. Well bred pigs look better, make faster gains, and also cheaper than scrub pigs.

Next year I intend to feed two more pigs and feed them from a self feeder to see if they will make more economical gains than those fed by hand. I have learned that a pig will make faster gains and cheaper gains when fed a balanced ration than on any other and that the quicker a hog is fattened after he is well grown, the cheaper the cost of the gain.

A boy who is wide awake, and interested in what he is doing, who is willing to try new methods, to experiment in feeding and caring for a pig makes a good pig club member.

Wisconsin. HENRY ACCOLA.

HOARD'S DAIRYMAN JUNIORS:—I am a pig club member because I am interested in pigs and have always liked to care for them. Through our county agent I was able to get a pure-bred sow from which my two pigs sprang. They have not yet been named as I have not sent for their papers. They are both for sale for breeding purposes and they will be named when sold with the papers.

I selected this breed through the advice of my parents as I could not get my favorite breed, the Hampshire, but I am beginning to think that the Duroc is as good a breed as any. I believe that pasture and green feed are very important in hog raising and I could mark from the very beginning the progress my pigs made when I began to pull weeds for them. I did not have a pasture for mine to run in that had much feed in it, so I had to cut the feed elsewhere and haul it to them.

Water is also a very important item in pig raising, so I gave them all they wanted to drink at all times. I weighed them once a week until they weighed 25 lbs. and each day they gained a half pound. Then I had to let them go as to the weighing until the end of the period. This was because I had no large scale. I fed them three times a day; in the morning corn and soaked barley and at noon swill made of ground barley, and at night the same as in the morning. At noon they also got whatever green feed I had for them. I spent some time playing with them and washing them and they soon became great pets. Mr. J. M. Coyner, our county agent, visited me and told me how to feed them and take care of them.

Pure-bred pigs are a great deal more profitable in a good many ways, and I figure it does not cost any more to keep a good hog than it does a scrub and the profits are sure to be larger in the end. And, oh, the joy of going to the fairs and more still if we are able to win the prize! As yet, I have made no plans for another year in the club work, but will be there I can assure you.

I have learned this much, that if one wants pigs that are worth while, he must keep them moving all the time and it surely takes a boy who is interested to make a good pig club member.

Wisconsin. LEROY CARLESON.

BROUGHT UP FROM THE VERY BEGINNING

Harford County Calf Club

This is the first year Harford County, Maryland, has had a calf club, though one-seventh of all the club members in the state come from this county. The county agent, B. B. Derrick, and his assistant, W. C. Snarr, with the aid of Louis Merryman and Herbert Hoopes, bought the Guernsey and Jersey calves for the members.

The meeting of the club was held on Saturday, January 22, in Bel Air. The officers elected for the coming year are: president, Edwin Preston; vice-president, Albert Ady; secretary, Richard Wills; and treasurer, Kenneth Wilson. A committee composed of Roland Davis, Albert Ady, and John Joesting were appointed to draw up a constitution and by-laws. The meeting was then adjourned to meet on Saturday, February the 19th.

The members started to keep records of their calves on the first of February. Monthly report sheets are kept by the boys and sent to the county agent's office at the end of each month, so a good line may be kept on the member's work.

The calves are of good breeding, and of the same blood lines as the best stock in the county. There are thirteen Jersey calves, sixteen Guernseys, and six Holsteins.

Harford County sent her best pigs in the boys' and girls' club to the Maryland State Fair at Timonium and won practically all of the prizes. That is what she expects to do in the calf club this year.

RICHARD WILLS, Secretary.

Junior Likes Agriculture

HOARD'S DAIRYMAN JUNIORS:—It has been a long time since I have written to you, but seeing that I now have a vacation from my school work, I will take the time.

We have just sold our capons. They averaged over seven pounds apiece and brought forty-eight cents a pound. We sold sixty-eight of them. Mr. Archibald, our teacher of agriculture, and I caponized them in June. We had very good luck with them and this summer I expect to caponize some myself.

We have thirty-seven head of cattle, but at present we are only milking thirteen of them. Fourteen of the others will freshen in the spring. The remainder consists of young heifers.

Our chickens are doing fine now. We are getting from 38 to 50 eggs a day and are selling them for 85c per dozen. We are feeding them a balanced grain ration and also chowder and they are certainly laying the eggs.

I am 15 years old now and am in the tenth grade in school. We have agriculture taught to us now and I surely do like it. We went to Trenton Fair on a field trip and we have taken several other short trips also. I like agriculture the best of all my subjects, because it is the only one that has to do with farm life.

I have two large Holstein heifers and am enclosing a picture of the largest. This was taken when she was two years and three months old. Her name is Lily and I think the world of her. But she thinks more than the world of me, too. My other heifer's name is Bessie. She is about two months younger than Lily.

New Jersey. ROLAND R. RENNE.

ROLAND RENNE AND ONE OF HIS HOLSTEIN HEIFERS

The Story of My Dairy Calf

HOARD'S DAIRYMAN JUNIORS:—I started the dairy calf contest work last spring. E. M. Gillig, teacher of agriculture at Sauk Center, got twelve boys in our neighborhood interested in it. I think we have a very good breed of dairy cattle at our place, and I am very interested in them. They are the Brown Swiss. I think they are the coming dairy breed; because they are so hardy and easy to keep, and give a large amount of milk, too. It is rich and well flavored. And they have a good quality of meat also, for being a dairy breed. So when the other boys were going to show how good the calves of their different breeds are, I made up my mind that I was going to show the rest of the fellows that I could do the best with my Brown Swiss.

I got my calf from my father. He and I work together on the whole

HENRY GABRIEL OF WISCONSIN AND HIS PURE-BRED BULL

herd, and I got a calf from him by working for it. He let me pick the calf I wanted, the little heifer calf from our good old cow, Believe, who was grand champion at our County Fair over all breeds in 1919. The name of our farm is the Farview Stock Farm, and I had my calf registered and called it Dorothy Believe of Farview. Dorothy was born July 24, 1919.

On April 16, 1920, my calf weighed 476 pounds. I started my feeding and my records from that day. We took a picture of Dorothy the day the contest started. She was a very nice, smooth calf, and showed very good type.

Then I started to give my calf pretty good care and careful feeding. I would often blanket her, and have always cleaned and brushed her, and kept her in a condition so that she was fit to show to visitors at any time. I kept an account of the feed she ate. She got bran, ground oats, oil meal, and slough hay most of the time. Here is about what her feed averaged by the month: 50 to 60 lbs. bran, 50 to 60 lbs. oats, 9 to 10 lbs. oil meal, and some slough hay, about 3 or 4 lbs. a day. She didn't get any skimmilk. She was in the pasture quite a bit of the time also. In the month of October we began to feed her some silage, about 8 lbs. a day.

In September my father took some of his herd to the state fair, and took Dorothy along. Down there she won the blue ribbon in her class, and there was some strong competition, too. The next week was our county fair and we took our stock to the Stearns County Fair also. Here my calf won the blue ribbon in her class, and Mr. McGuire, the judge, said my calf certainly was an excellent animal. I had her so she would stand the way I wanted her to and would lead well. I did lots of training on her and she was very gentle.

When the calves in the dairy calf contest were led in the ring, Mr. McGuire gave my calf the first prize, and, when Mr. Gillig figured up everything, my calf was the winner She is in fine shape. I groom her every day and blanket her.

This was a very interesting year for me, even if I did work hard. I spent a lot of time on my calf and I also worked on the herd right along with Dad. We did some official testing and I helped with that. I have learned how to raise calves, and also about handling the herd. I think official testing is a good thing, too.

Minnesota. GEORGE MINETTE.

Junior Letters

Hoard's Dairyman Juniors:—I am thirteen years old and in the eighth grade. I live in the beautiful blue grass region of Kentucky. The country is rolling and fertile. My home is about one-half mile north of Taylorsville on a hill. Taylorsville is in a valley at the junction of Salt River and Brashers Creek. The "L" and "N" railroad runs through the town.

Our farm, which is situated on the creek, consists of 66 acres of limestone soil. Twenty-four acres is bottom land and the rest is fine blue grass hillside. We had a fine crop of corn and tobacco this past year. We have six pure-bred Jerseys which will be fresh in a month. We also have two mules, two colts, and a driving horse. Mother has about 100 pure-bred White Wyandottes. I have a pair of White King pigeons and another pair of Blue Barbed Homers. We also have a dog and several cats. Will some of you juniors write to me? My address is Taylorsville, Ky.

Thompson Durall.

Hoard's Dairyman Juniors:—If you will permit me, since I have read the article published over the signature of D. M Green in Farmers' Bulletin 1114, I would like to give you my experiences and ideas relative to roup and chicken pox. I am a raiser of poultry and have been for 40 years. In my earlier days my hens used to be bothered with both of these diseases and I have lost many birds with them. But since I have learned the true cause of them, I have not had a single case of either in my flock.

Roup is caused by chickens roosting in drafts. Build your hen houses facing the south [illegible] g all the other sides closed. Then the south side and you will have neither roup nor sore head. The latter disease is caused by mosquito bites here in the South. Limber neck is caused by maggots lodging in the neck of the affected bird. Do not allow your flock to eat decaying meat and you will not be troubled with this disease.

Texas. C. D. Poole.

Hoard's Dairyman Juniors:—We have six cows and we have twenty acres all seeded with clover and grass. I am in the sixth grade. It is only a small school and only a few scholars. I like Jersey cows the best of all. We have two Jerseys and the rest are Holsteins. We are getting ten gallons of milk a milking. Most of them are all fresh just a week or two.

Washington. William Bower.

Hoard's Dairyman Juniors:—In looking over the Junior Page a week or two ago I saw the article you put in about facts when writing to the Junior Page, and I read it over very carefully.

In your letter you said that you thought it would be better to buy a calf and raise it to be a cow. I think so, too, and have thought of buying a calf many times, but have never done it yet, but plan to soon.

I am going to Madison high school this year and like it fine. I am taking four studies. They are as follows: Commercial Arithmetic, General Science, Algebra, and English. I like them all. We have been taking tests this week. There are about 200 students in our school and seven teachers.

We are milking eight cows now, and are making from 35 to 40 pounds of butter each week.

I am using my brother's typewriter to write this letter for the Junior Page.

I wish some of the juniors would write to me. My address is R. F. D. No. 1, Madison, Maine. Wilbur J. Ketchum.

Hoard's Dairyman Juniors:—We are living on an 80-acre farm. We have about 40 acres clear. This land is best for grasses such as timothy and clover. Blue giant clover grows from four to five feet high. Grain of all kinds grows here and is always first class. Everybody around here likes this land for it gives such good crops. Our cows have clover all year round in pasture but sometimes they blow up. We have seven cows at present. They don't milk very much because they will freshen soon. But in summer they each give six gallons a day.

I also have three Belgian hares and they grow fine.

Minnesota. Frank W. Urianek.

Hoard's Dairyman Juniors:—My father has taken the Hoard's Dairyman for several years and we like it very much.

I live on a farm of 160 acres, all of which is under cultivation except about 10 acres of maple timber. We have 20 head of high grade and registered Holstein cattle, but are only milking 8 now. We also have 6 horses, 15 hogs, and about 60 Rhode Island Red chickens.

I am going to high school now for my second year. We have a fine school of nearly 400 pupils, I enjoy my school work very much and like my teachers very well. I wish some of the juniors would write to me. My address is Box 699, Carson City, Mich.

Robert Bollinger.

Hoard's Dairyman Juniors:—I have some Belgian hares. I keep some of them in the corn crib. The rest I have a pen for. I feed them corn, oats, carrots, beets, and milk in the morning. At night I give them oats and water and make sure they always have plenty of hay. Now a word about dad's stock. He has 17 head of pure-bred Holstein cattle: five heifers, 11 cows, one bull.

Minnesota. John Crumb.

Hoard's Dairyman Juniors:—We had three weeks' vacation in our school as our teacher was sick. There are five of our pupils going to write for diplomas. I am one of them. There are 17 pupils in our school and we expect another one soon.

We are milking 9 cows, 8 of them are fresh ones. We have a cow that had twin calves Saturday morning. Both of them are females. We have 38 head of stock in our barn.

Wisconsin. Theodore Lehmann.

Hoard's Dairyman Juniors:—I live on a 120-acre farm on Big Foot Prairie, Ill., and am a Freshman in Harvard high school. We keep 31 head of stock, 15 of them are cows. We weigh our milk and test it. We also keep 5 draft horses. We did keep Duroc Jersey hogs but did not like them and are going back to the Poland Chinas.

My brother and I are raising a Holstein calf. She is 2 months old and weighs about 200 pounds. She has a fine udder and bears the signs of a good milker.

My mother keeps 85 Plymouth Rock chickens. I raised White Pekin ducks this year. One young drake weighed 8½ pounds. I like all kinds of poultry, pigeons in particular. I keep about a dozen pigeons and a pair of Red Homer and a pair of White Homer doves. If any of the juniors keep doves or are interested in them I wish they would write to me. My address is Route 3, Walworth, Wis.

Perry Goranson.

Mayer *Honorbilt* Work Shoes

MADE of honest leather, "Built on Honor" by skilled workers, *Honorbilt Work Shoes* will give double the wear of ordinary shoes.

Suitable for every kind of work on the farm too. For the leather in *Honorbilt Work Shoes* is double tanned to resist the alkali in the soil and the leather-eating barn yard acids.

And you will find these long wearing shoes always soft and easy on your feet. Wet work will not make them hard; they stay pliable and comfortable with the roughest use.

Honorbilt work and dress shoes, for every one in the family, are sold by leading dealers everywhere. All bear the *Mayer Honorbilt* trade mark—a guarantee of quality that never fails. Look for it on the soles and if your dealer does not handle *Honorbilt Shoes* write us.

F. Mayer Boot & Shoe Co., Milwaukee, Wis.

Save Time, Save Trouble ~ get more milk with UNION GRAINS!

IT takes time to mix special feeds and in the absence of the most careful selection and tests you can't be sure of the ingredients. Let us take the trouble off your hands and give you a *certainty!*

For 17 years Union Grains has been made to the same splendid formula. Hundreds of dairymen—feed experts themselves—have tested it against the best of home mixed feeds—and then adopted Union Grains for good! They know it pays!

For the man who appreciates the good business of feeding good feed to good stock and who has plenty of other work to do Union Grains is a God-send!

Try a load now!

Ask for a Union Grains Cost Sheet. It will show you where your profit comes from, and help you spot the "boarders" in your herd.

The silver lining to the passing cloud

Ever hear the old saying "High-priced seed means a low-priced crop"? Ever notice that *the reverse is equally true*—and that today's situation should therefore spell OPPORTUNITY to the farmer who has "his ear to the ground and his eye to the future"?

He knows that over-production never occurs two years in succession. He is assured better distribution of next season's crops because of greatly improved transportation conditions.

That is the "silver lining" the wideawake farmer sees on the cloud of low prices now passing. While others are waiting, *he* is acting. And when the rise comes *his* crops are ready; *he* "cashes in".

He is going to use fertilizers—*good* fertilizers. For he is the kind of farmer who never thinks of missing the profitable extra yield they produce. He is ordering them now—to avoid last-hour rush and probable delay in getting them.

A A C Fertilizers carry extra-yield assurance because they are good fertilizers. They are good fertilizers because they are *made RIGHT.* Have *you* ordered yours?

WRITE for our fertilizer suggestions (mention your soils and crops) and booklet "How to Get the Most out of Fertilizers". Free.

Sand Soil Salvation

(Continued from page 261)

that an abundance of rain is the bane of their existence. At any rate, grasshoppers do thrive and by some are classed as a scourge in the sand country where soils dry out quickly. Early in the growing season they come forth. Some years they are worse than in others. A few sand farmers are combating them with poison bran mash, which appears to be effective locally but because it is not used universally, and due to the hopping proclivities of this insidious insect, the effectiveness of the method is questionable. Mr. Frost is of the opinion that after all fertility is one of the best solutions of the whole problem. "I have noticed," he stated, "that the poorer the soil the greater the crop injury from grasshoppers. Not that they are more plentiful on run-down land, but the crops grow so slowly and poorly that the grasshoppers get the best of them, especially with clover and alfalfa—two crops which are particularly relished by these arch enemies of our community. On good fertile, limed, sandy soil both alfalfa and clover grow so fast that they usually get ahead of the hoppers and the injury is comparatively less."

"I had supposed," I contributed with some apprehension, "that the worst scourge from the standpoint of personal comfort of the sand country was the sand bur. I've been expecting to be made aware of their penetrating presence about my ankles most any minute as we walk over these fields."

"Oh," he laughed, "fertility knocks them galley-west, too. I am glad to say that I don't think you will find any on this farm. Where you keep up the fertility the crops crowd them out. Fertility is the remedy for a whole lot of the woes of sandy land farming."

Mr. Frost calls the soy bean the "dual-purpose" member of the legume family of plants.

"It is not only a soil improver," he declared with much enthusiasm, "gathering most of its nitrogen requirements from the air, but it furnishes us with a protein rich forage for hay or silage or a concentrated feed in the form of the threshed beans. And, Great Heavens, soy beans, if inoculated, do grow in sandy soils. I've seen fields of them in this section that would surpass the best on heavy clay and clay loam soils worth double and treble what this land can be bought for. We grow them for seed—for hay, especially when we need an emergency hay crop, and we plant them with corn for silage, using about two-thirds corn and one-third soy beans, but planting the corn at the usual rate and using the soy beans in addition. Ito Sans, Manchus, and Early Blacks appear to be our best varieties. We will come to grow more soys. I believe they will make one of our best cash crops when grown for seed purposes."

Potatoes are a prominent crop on the Frost farm, as they are on most every farm in that territory. They furnish the principle income as a cash crop and are very essential in maintaining a dollar and cents balance on the right hand column of the sand farmer's ledger. But it is equally important to keep live stock to consume the roughage produced by those soil builders, clover and alfalfa, in conjunction with corn silage to furnish manure so essential for fertility maintenance. Mr. Frost kept a splendid herd of pure-bred Holsteins but a serious accident crippled him to such an extent that, together with the difficulties of the farm labor situation,

To Farm Owners

Ropp's Calculator is worth many dollars to you, Mr. Farm Owner, but if you will just send us your name and address it won't cost you a cent. We will send you one free and postpaid. No book of this kind has ever been published that meets the everyday requirements of the farmer like Ropp's Calculator. Tells you almost anything you want to know—number of acres in a field; capacity of bins, tanks, etc.; how to measure hay in mow or stack; how to compute wages, interest, etc., and answers thousands of other perplexing questions. We will send you, too, our latest catalogue of

Square Deal Fence

For many years Square Deal Fence has been the choice of thousands of farm owners, because it best meets their requirements for appearance and durability. Made of best quality open hearth steel, heavily galvanized. Square Deal Fence always stands neat and trim, and requires fewer posts because of its better construction; the wavy or crimped strand wires expand and contract with heat and cold, but always stand tight. The heavy picket-like stay wires are locked to the strand wires with the famous Square Deal Knot, giving rigidity not found in other fences. Send for free books today; learn how you can save money by buying Square Deal Fence. (84)

DON'T PUT OFF

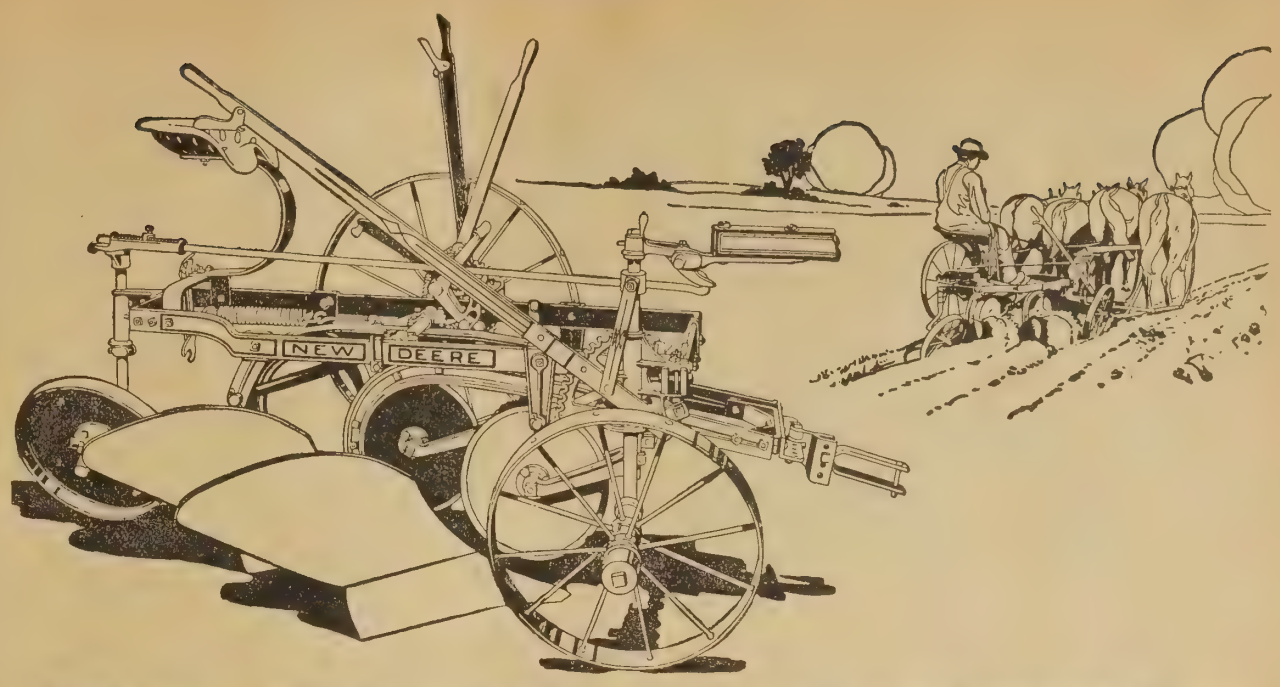
Seeing your friends and having them join in for a club of subscribers.

it was necessary for him to dispose of his herd and eliminate milking. He now plans to feed steers to consume his roughage and to produce manure.

"One of the best parts of my farm is this open shed where I feed and where the manure accumulates with full protection against waste from leaching rains. The heavy soil farmer in general never has a full appreciation for the value of proper care in handling manure. The sand farmer has got to appreciate it or he is doomed. I believe I get the most out of my barnyard fertilizer by putting it on sod crops. I think there is less loss from leaching—a process that goes on only too rapidly in sand."

Outstanding Methods

Sandy soil farming has a multitude of problems connected with it which all come under the one head of fertility development and maintenance. I talked with the local banker about the general situation. He was enthusiastic about the possibilities of sandy land farming, but—to use his own words—"We have all got to adopt Frost's soil building methods and Frost's soil building enthusiasm. His methods are outstanding, and results speak for themselves. We need such outstanding methods instead of outstanding agriculture. There's soil robbery going on around here—too much of it—this land won't stand it—there is no place in all the wide world where there is more truth in the statement that a man who cheats his soil cheats himself, or else he cheats his children. Rather than see one of our customers tear down his soil to build up his bank balance and our bank deposits, I would a hundred times rather see that man bank his surplus into the land in the way of soil improvement. We have a few men like Frost who are farming with an eye to the future, who are using lime and growing alfalfa and all that sort of thing, but we need more of them—for they are the salvation of sandy soils."



High School Tests Cows

An interesting contest in the testing of cows is being conducted by the agricultural department of the Eatonville, Washington, high school. Thirteen farmers have entered their herds. The work is conducted quite similarly to that in cow testing associations. The farmer weighs the milk and submits a sample to the school for testing each month. Students in the school figure the yield of the different cows and the cost of feed, and make estimates of the profits. The prizes, from five to ten dollars, are given each month for the highest production. In November F. Krones won the highest prize with a cow producing 44.73 pounds of fat. In December John Malm was given the highest prize on a cow which produced 41.52 pounds of fat.

Jerseys in Bull Associations

More than sixty pure-bred Jersey bull associations are now in operation. The last report from the Dairy Division indicates that 2,349 farmers are members of these associations. At that time there were 59 owning 266 pure-bred Jersey bulls. These bulls were being bred to 11,726 grade cows and 1,568 pure-breds.

South Carolina leads in the number of associations with 12; Mississippi has 11; North Carolina, 6; Alabama, 5; Indiana, 5; Missouri, 3; Pennsylvania, 3; Tennessee, 2; Washington, 2; Oregon, 2; Utah, 2; Idaho, 2; Vermont, 1; Georgia, 1; Louisiana, 1; Arkansas, 1; Illinois, 1; Virginia, 1.

Plowed its Way to Leadership

THE New Deere Gang was introduced to farmers 26 years ago. It was built for farmers who want the best—farmers who know that it is real economy to buy a plow that insures extra years of good service. The New Deere Gang quickly plowed its way to leadership. For many years it has been the leader of its type. Its record proves that most farmers want the best plow they can get and that the New Deere Gang meets their requirements fully.

Ask also for our big, free book, "Better Farm Implements"—114 pages—illustrates and briefly describes John Deere implements for practically every farming operation—has valuable information on the operation of implements. Address John Deere, Moline, Ill. Ask for package DG-514.

NEW DEERE GANG

Leadership of this plow is due, first of all to the high quality in its genuine John Deere bottoms. They are made by men who have spent years in studying soil conditions in all sections and designing plow bottoms to meet those conditions to best advantage. John Deere bottoms scour, pulverize, make a good seed bed—do the work the way the farmer wants it done. There is a type and shape for every soil. Made of the best plow-bottom materials and reinforced where wear is greatest, these bottoms are unusually long lived.

Makes Uniform Seed Beds. Because of double bail construction, full plowing depth is reached almost instantly and even depth of furrows is maintained. Front furrow wheel is controlled by a handy lever adjustment, insuring even width of furrows.

Pulls Light. The New Deere Gang is all-wheel-carried—no landside friction—no dragging of the bottoms. And the clean-scouring qualities and general high grade construction of the bottoms are great aids to light draft.

A Boy Can Operate It. Foot lever and auxiliary hand lever make it easy to lift the bottoms under all conditions.

Quick Detachable Shares—loosen one nut to remove share; tighten the same nut and share is on tight. **It stays tight.**

Long-lived. Made of only high grade materials, the New Deere Gang lasts much longer than ordinary plows. Fewer repairs are required.

See the New Deere Gang at your John Deere Dealer's. Inspect it thoroughly. Remember it has been the most widely used horse-drawn gang plow for 26 years. That's an A1 recommendation. You will find this plow an especially good investment.

JOHN DEERE

JOHN DEERE MOLINE, ILL.

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

Why a "B-V-T" Silo is the Best Investment

Because it has been on the market TEN YEARS, without a SINGLE FAILURE.

Made of famous Brazil Vitrified Fire Clay—ONE ton costs as much as FIVE tons of shale.

THE "B-V-T" WILL LAST FOREVER

Will not freeze or crack. Keeps silage in perfect condition. You never have to rebuild a "B-V-T"

WHO AM I?

I am the fellow that Milks With

"MEHRING'S MILKER"

It makes me smile when I see poor guys pulling away by hand. Buy a Mehring Milker and you can smile too. It was the first practical milker and still has the lead in speed, efficiency and cheapness of operation and repair. Send for a catalogue and be convinced. It will milk one or two cows at once. Price $80 cash or $85 on trial. Also engine power milkers.

W. M. MEHRING, Keymar, Maryland.

When Writing to Advertisers, Mention Hoard's Dairyman

Milking in One Third the Time Helps Keep Young Folks on Farms!

There is no questioning the fact that milking machines make farm life more attractive to children—for the drudgery of milking becomes an interesting occupation instead of work—with the dependable

HINMAN MILKER

They solve the help-problem for it is simplicity itself for even ten-year-olds to do the milking.

Over 50,000 in Daily Use

saving time and money for progressive dairymen everywhere.

Hinman Milkers are the easiest to clean and operate. They save their cost the first year.

Write for catalog—and with it we will include copy of "The Hinman Handshake" that gives facts you'll like to have.

Hinman Milking Machine Co., Oneida, New York

We also make Electric Milkers with 1-6 H. P. motor operating on alternating or low voltage current. No installing.

DAIRYING PAYS

If You Feed

International Special Dairy Feed

At the New Rock-bottom Price

We have slashed the prices on International Feeds both ways from the middle. Of course we are taking a loss, but we are ready to do this to play the game with the thousands of feeders who have so wholeheartedly approved International Feeds for years.

Don't take the price drop in your dairy products too seriously. The cut we have made in price on International Special Dairy will allow you to feed it at the same old good margin of profit. Same feed, same quality, at a smashing drop in price.

International Special Dairy Feed Is Guaranteed

to produce more milk than any other feed of similar analysis. You should get two more quarts of milk per day from each cow.

Remember that this feed is priced down to produce milk at a profit on the prices you secure. Write us direct for full information if you have no International dealer near you.

LIVE AGENTS WANTED—A live agent can quickly sell several cars of feed in each vicinity at this new, low price. Write for details.

Cow Testing Associations

(Continued from page 269)

silo. This association hopes to put some in new districts this year. Cocoanut meal sells for $20 per ton in cash. This feed is fed quite generally by dairymen and is worth about twice that price compared with the prices of other feeds on the market.

Lyon County, Kansas:—Milk sold to the Missouri dairy brought 72½c per pound butterfat in January. Cream sold for 45c per pound fat. Bran is rated at $1.50 per cwt.; corn chop, $1.20; cottonseed meal, $40 per ton; silage, $5; alfalfa, $10.

Coshocton County, Ohio:—January market milk sold for $4.18 per cwt., a test of 4% required. The creamery paid 50c per pound for fat. Milk retails for 14c per quart, butter for 60c per pound.

Clinton, Pennsylvania:—A countrywide membership campaign is on to interest more farmers in the work of the farm bureau. All but one member of this association joined. Two registered sires and one registered heifer calf were purchased. There are now but two scrub sires in use. Another member has installed drinking cups in his barn. January 3% milk sold for $3.18 per cwt. and 4c per point above. The creamery paid 65c per pound for fat. Feed prices are: bran, $42 per ton; gluten, $50; oil meal, $48; corn and oats, $43; silage, $6; hay, $25.

North Branch, Pennsylvania:—Ten cows were eliminated during the month, nine of which were unprofitable. Four pure-bred bulls and two pure-bred heifers were purchased. Four Advanced Registry records were made and several cows are still on official test. January 3% market milk sold for $3.40 per cwt. and 4c per point above. Milk retails for 12c per quart, butter for 60c per pound, and cheese for 28c per pound. Corn silage sells for $8 per ton; corn stover, $6; mixed hay and alfalfa hay, $20—$25; cottonseed meal, 43%, $60; linseed meal, $55; corn and cob meal, $24.

Southern Harford, Maryland:—Three cows were disposed of during January as unprofitable. One member has started in the pure-bred business with two Guernseys. Another member replaced his grade bull with a pure-bred bull calf.

Salem County, New Jersey:—Milk prices range from $2.57 per cwt. at the creamery to $7 per cwt. to hotel trade. Several members ship to hotels and receive good prices. January feed prices are: gluten, $60 per ton; cottonseed meal, $50; oil meal, $52; oats, $48; bran, $46; beet pulp, $50; corn and cob meal, $27; brewers, $50; silage, $10; mixed hay, $20—25; alfalfa, $30.

Year's Work of Clinton C. T. A.

The Clinton Cow Testing Association, Pennsylvania, has completed its first year of work with the following results. Out of 28 herds, 26 completed the test for the year. The average production of all herds for the year was 6,020 lbs. milk and 268 lbs. butterfat. To G. G. Gaylord goes the distinction of having the highest herd

average in yield of butterfat. His herd of grade Jerseys averaged 340.8 lbs. butterfat in 6,516 lbs. of milk. The lowest producing herd made an average production of 193 lbs. butterfat in 4,444 lbs. milk. The second best herd in fat production was that of W. F. Hauenstein which averaged 323 lbs. fat, 6,582 lbs. milk. The herd averaging the highest in milk is owned by R. G. Erk, the production being 8,544 lbs. milk and 315.7 lbs. fat per cow. The lowest milk producing herd averaged 4,063 lbs. milk and 197.3 lbs. fat. A grade Holstein owned by R. G. Erk tops the list in the yield of milk. Her record was 11,696 lbs. milk containing 375.7 lbs. butterfat, at a net profit of $195. Later she sold at a record price. The most profitable and champion butterfat cow is a grade Jersey owned by W. F. Hauenstein. Her owner tried to sell her and "nearly gave her away" prior to the test, but she surprised him with a record of 465.4 lbs. fat in 8,578 lbs. milk at a profit of $214.35. To F. S. Wildenstein goes the credit of having a record cow in the honor roll every month during the year.

The dairymen of this association saw readily the advantage in owning pure-bred sires, with the result that twelve pure-breds replaced scrub bulls, making a total of seventeen pure-breds in the association at present. Five other members are making use of their neighbors' sires. Five silos were erected and four of the members installed drinking cups. Two milking machines were put in use and one electric light plant. Eighty-six cows were culled and sold as unprofitable. One herd of registered stock was bought and distributed among the members. Kenneth S. Bailey, the tester, states that at the present prices for feed and labor a herd must produce more than 6,000 lbs. of milk and 200 lbs. of butterfat per cow annually in order to yield a profit to the owner. Twenty of the 26 members joined for the second year's work.

Recent Guernsey Records

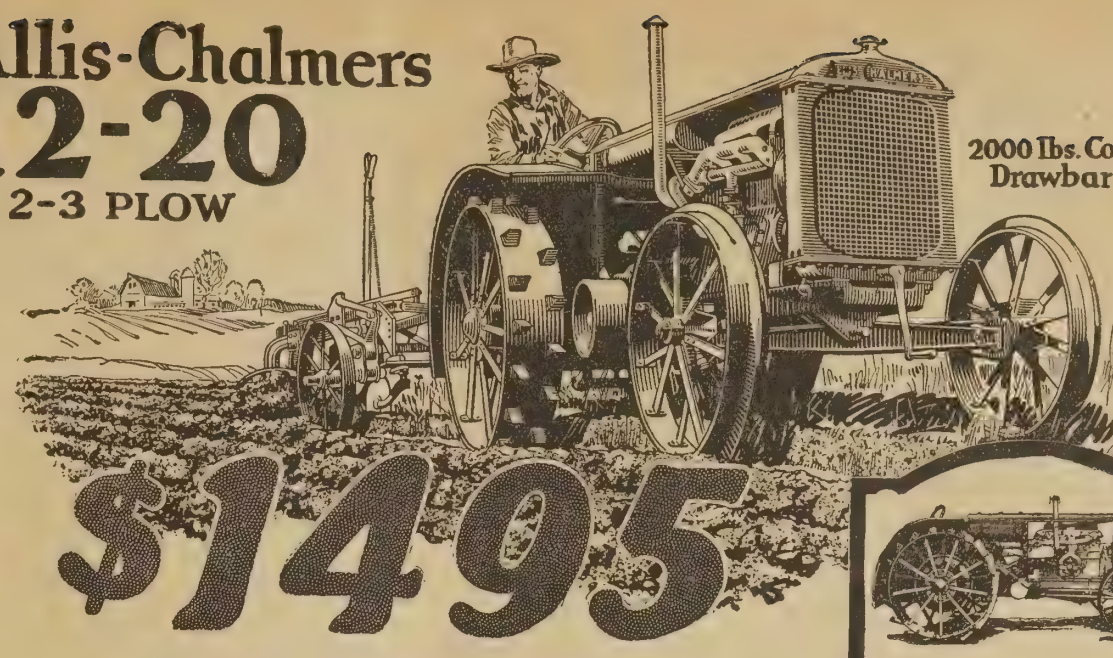
A number of very creditable records have recently been completed by Guernsey cows. Among these are the following:

Imp. Flora's Sailor Girl, owned by W. A. Munn of Wisconsin, as a two-year-old produced 11,676.5 pounds of milk containing 559.03 pounds of fat. She carried a calf 268 days of her test period. She has qualified for eighth place in class GG.

Ultra May Queen, owned by High Point Springs Farm, New York, now holds tenth place in class D with a production of 14,608.1 pounds of milk containing 757.74 pounds of fat. This record she made as a three-and-one-half-year-old.

Masherlette of Harbor Hill 2d, owned by Robert Stuart of New York, was a world's champion in the two-and-one-half-year-old division from December 18th to 25th, 1920. Her record of 12,602.2 pounds of milk and 634.3 pounds of butterfat in class FF exceeded that of the previous champion, Little Star of Glencairne, by 63.08 pounds fat. On Christmas Day her record was exceeded by that of Park's Judith Beauty, which produced 646.15 pounds of fat.

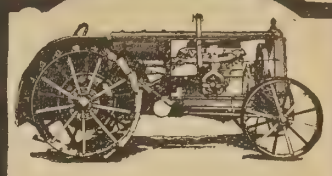
Folly Laura has qualified for fifth place in class GG as a junior two-year-old with a record of 10,270.3 pounds of milk containing 572.09 pounds of fat. She is owned by R. H. Connelley of Illinois.



Seventh place in class AA is now held by Contrafuria, owned by F. K. Babson of Illinois, with a production of 15,764.8 lbs. of milk containing 745.09 lbs. of fat. She carried her calf 265 days of the test period.

Elm Road Polly, by completing a production of 10,976.9 pounds milk containing 647.18 pounds of fat, has come within 23 pounds of equaling the world's record for the breed in class DD. She holds second place in the division.

By completing a record of 15,015.8 pounds of milk containing 772.99 pounds of fat in the four-and-one-half-year-old division, Stranford's Verena of Chippewa, owned by L. P. Martiny of Wisconsin, takes tenth place in class B.



Katherine's Trixie, owned by Walter C. White of Ohio, now holds the world's record among two-year-olds in both milk and butterfat, her record being 18,495.7 pounds of milk containing 791.48 pounds of fat. She replaces Langwater Hope which has held the championship in this class for eight years.

Allis-Chalmers 12-20
2-3 PLOW

2000 lbs. Constant Drawbar Pull

$1495

IN this 18-30, Allis-Chalmers engineers worked out every construction feature which has been incorporated into the new A-C 12-20. Lubrication of the 18-30 is force-feed; air entering carburetor is first washed—freed of every particle of dirt and dust; "line-up" for belt work is made easy by use of automobile type of steering. It easily handles 4-6 24-inch discs or 3-4 mouldboard plows, with abundant reserve for emergencies.

MATCH IT IF YOU CAN!

$42,500,000 Allis-Chalmers Company Offers Perfected Tractor at an Unequalled Price

AFTER seven years' development, one of the world's largest manufacturing organizations goes into large-scale production—offering perfected tractors at volume prices! To build a tractor more economical to operate, with greater reserve power, with brute endurance—this was not the only aim of foremost consulting engineers and one of the world's largest engineering staffs when work first started on Allis-Chalmers tractors, seven years ago. A matter of equal importance was how to combine with super-quality a *low price*. For Allis-Chalmers sought a tractor lower in first cost than others of its rating, as well as cheapest in cost per year of service.

Seven Years to Build This Tractor

Vastly more than "blue-print" perfection was demanded by the $42,500,000 Allis-Chalmers Mfg. Co., with a world-wide reputation and over a half-century's experience in building machinery for some of the largest factories and engineering projects in the world. Constant factory and field tests—of the severest sort—were to *prove* these tractors *perfected* before Allis-Chalmers would go into volume production.

Naturally, adherence to such standards meant that many *different* models be built—that development continue for a period of years. So Allis-Chalmers proving and improving went on. In the mammoth general plant, tractors were built for testing—*in quantities of only five at a time.* Design was changed at will. For it did not mean the sacrifice of thousands of dollars' worth of specialized machinery whenever better construction was discovered.

Finally, a finished A-C 18-30 was built—embodying every improvement resulting from seven years of thorough, careful engineering. Long-time tests were conducted—in every kind of soil. In limited numbers, tractors were released into every section of the country. It was the "O. K." of the farmer that Allis-Chalmers wanted! And not a single A-C 18-30 owner made complaint about the service.

It was on the basis of this remarkable record that the perfected Allis-Chalmers 12-20, here offered, was designed—*embodying the same time-tested features which have made the A-C 18-30 famous.*

Now, with final designs proven *right*—with one of the largest tractor plants and foundries completed—the $42,500,000 Allis-Chalmers Company goes into volume production with prices down to almost unheard of levels!

One Hundred Tractors a Day!

This is the mammoth production capacity Allis-Chalmers has provided. Every economy resulting from volume manufacturing is reflected in the 12-20 price of $1495. Every saving due to the enormous buying power of this $42,500,000 institution is passed on to the buyer.

Point for point, quality for quality, the 12-20—like the 18-30—represents one of the greatest values in the industry. You find its heavy-duty, smooth-running motor, for example, more accessible than the engine of a motor car or truck. Though rated at 2000 lbs. drawbar pull, it is actually capable of developing and maintaining a power surplus of 25 per cent. Removal of two side inspection plates exposes entire crankcase; valves can be reached for grinding or cleaning of carbon by taking off a single cylinder head; complete access to transmission is secured through a large dust-proof cover plate; clutch shoes can be removed for re-lining in 15 minutes. An exceptionally large copper fin-and-tube type radiator prevents overheating, even in the warmest weather.

Compare the Allis-Chalmers 12-20 with other tractors up to $1800—and match it if you can! Match its modern design! Match its reserve power! Match its wonderfully excellent construction—its materials—its workmanship—its downright durability!

WRITE FOR BOOKLET TODAY—Ask for the 18-30 or the 12-20 booklet—or both—giving complete details of exclusive Allis-Chalmers construction features which make these tractors so advanced in design.

DEALERS—Write today for attractive dealership and jobber proposition. Share in the mammoth sales co-operation program which goes with Allis-Chalmers' 100-tractor-a-day production capacity!

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Simple Mammitis

The affix *itis* means inflammation of, and the word mammitis therefore is inflammation of the mammary gland or udder. Mastitis is another term for the same condition and by stockmen it is termed garget or caked bag. It is a catarrhal condition of the membrane lining the ducts of the teats and udder.

This form of mammitis has to be differentiated from acute mammitis and contagious mammitis which will be considered in subsequent articles. It is not difficult to make a correct diagnosis of this simple ailment as an attack does not cause fever or any serious derangement of the system. Usually but one quarter of the udder swells and becomes more or less hot, red, and painful. The milk changes in consistency and contains curds or clots, but is not brown or bad-smelling and does not contain pus. The cow may be a bit stiff or straddle a little in gait, but rarely loses appetite. Milk secretion, however, may be lessened in quantity. Some attacks come on without appreciable cause, occasion very little disturbance, and quickly subside. Many attacks, on the contrary, tend to run into the acute form if not promptly and properly treated, and especially when they recur.

The known causes are many and different. Some of the commoner ones are chill, shock, bruise, irregular, rough, or incomplete milking, change of milkers, coming in heat, prolonged excessive feeding of protein-rich feed, running, chasing by dogs, chafing, standing in cold water when warm, and slight injuries.

A rarely recognized cause is sucking of the teats by other calves during the early days of life when milk is fed. This tends to cause a slight attack of garget which comes on again at the birth of the first calf. It may also result from the "drying off" process. Lying upon bare or insufficiently bedded concrete stall floors is another unsuspected cause and attacks may likewise result from lying upon cold, wet, or frozen ground when the udder is congested.

The rear part of concrete stall floors should be covered with cork brick or boards and be well bedded and stalls should be wide enough to prevent cows from stepping upon one another's teats. Also see that cows do not have to step over high sills in doing which they are liable to injure their teats. So far as possible remove or avoid all causes mentioned.

Isolate a cow whenever anything goes wrong with her udder. Keep her separate and milk her last until perfectly recovered. There is no absolutely specific remedy. Each veterinarian has his own pet plan of treatment. On general principles, however, it may be advised to reduce rich feed, and frequently strip the udder clean, foment it with hot water for 15 minutes every 2 hours, massage thoroughly each time, and rub in a mixture of 1 part each of turpentine and fluid extract of poke root and 6 parts of sweet oil or melted lard once or twice daily. This lotion may, if necessary, be increased in strength. It is also usual to start treatment by giving a pound dose of Epsom salts in warm water sweetened with molasses and following with half-ounce doses of powdered saltpeter and poke root twice daily until the attack subsides.

Heaves

I bought a mare out of the stockyards last fall and she is heavey or wind broke. Is there anything to be done to relieve her condition?

Festus, Mo. E. J. J.

Emphysema of the lungs (heaves) is incurable when established. Distress may be relieved by feeding wet oat straw in place of hay in winter and making the horse live on grass in summer. Oats, bran, and roots or silage may also be fed. Keep the bowels active. Do not feed any bulky roughage at noon if the mare has to work and do not work her immediately after a meal. If distress is great, give her half an ounce of Fowler's solution of arsenic night and morning until symptoms abate; then gradually discontinue the medicine, taking at least 10 days to the process.

Tuberculosis

I have a Jersey cow four years old that is so thin and weak she doesn't drink only very little water and won't eat. I try everything which I think she will eat. She has had a cough for over a year. She will cough for five minutes and her milk is blue.

Alexandria, So. Dak. A. K.

The cow apparently is in the last stages of tuberculosis and should be destroyed. A veterinarian should then make a post mortem examination and if the disease is found present test your other cattle with tuberculin. The milk of such a cow is dangerous to people and animals. The stable will have to be cleansed, disinfected, and whitewashed under direction of the veterinarian.

Supernumerary Teats

Kindly give me advice as to handling a six-teated heifer that has just come in with her first calf. While I milk four teats the two extra teats leak milk. They are about the same size as the other teats. Shall I milk all the teats or leave the two extra ones to dry up? I am now milking four teats but her udder is so hard that I am wondering if her udder will go down if I do not milk the extra teats.

Wayne, Ill. W. C. P.

The extra teats should have been amputated early in life and it may be possible for a veterinarian to do so when the heifer is dry. Meanwhile, try to dry off secretion in the rudimentary glands by twice daily rubbing in a mixture of equal quantities of fluid extract of belladonna and camphorated oil, gradually lengthening the time between milking and finally stopping the milking process.

This is a good time to plan crop rotations and to plot next summer's field work.

How to Stop
Calf Scours

You can do it in a quick simple reliable way—costs little. One good calf saved will repay the expense of protecting your whole herd for a long time against this infectious disease.

Leading breeders and dairymen throughout the country say there is nothing like B-K. It contains no poison or acid—It is clear as water and safe to keep anywhere.

B-K acts as an anti acid and sweetner in stomach and also quickly kills the germs that cause scours or diarrhoea. It heals the inflamed membranes, relieves irritation and restores healthy action.

SAVE EVERY CALF

It's so simple to keep your barns sanitary and your animals in a healthy condition. B-K also prevents such germ diseases as Abortion, Retained Afterbirth, Barrenness, Calf Pneumonia, and you have this wonderful help all in one bottle—always ready.

Keep a supply of B-K handy for all the "little ills" of the barn—cuts, scratches, anything where infection can do harm.

GENERAL LABORATORIES

"You'll Always Find"
says the Good Judge

That you get more genuine satisfaction at less cost when you use this class of tobacco.

A small chew lasts so much longer than a big chew of the ordinary kind. And the full, rich real tobacco taste gives a long lasting chewing satisfaction.

Any man who uses the Real Tobacco Chew will tell you that.

Put up in two styles

W-B CUT is a long fine-cut tobacco
RIGHT CUT is a short-cut tobacco

Weyman-Bruton Company, 107 Broadway, New York City

A Co-operative Creamery in Idaho

(Continued From page 260)

secures a good placing for "Sunshine Brand" in the annual Northwest Dairy Products Shows.

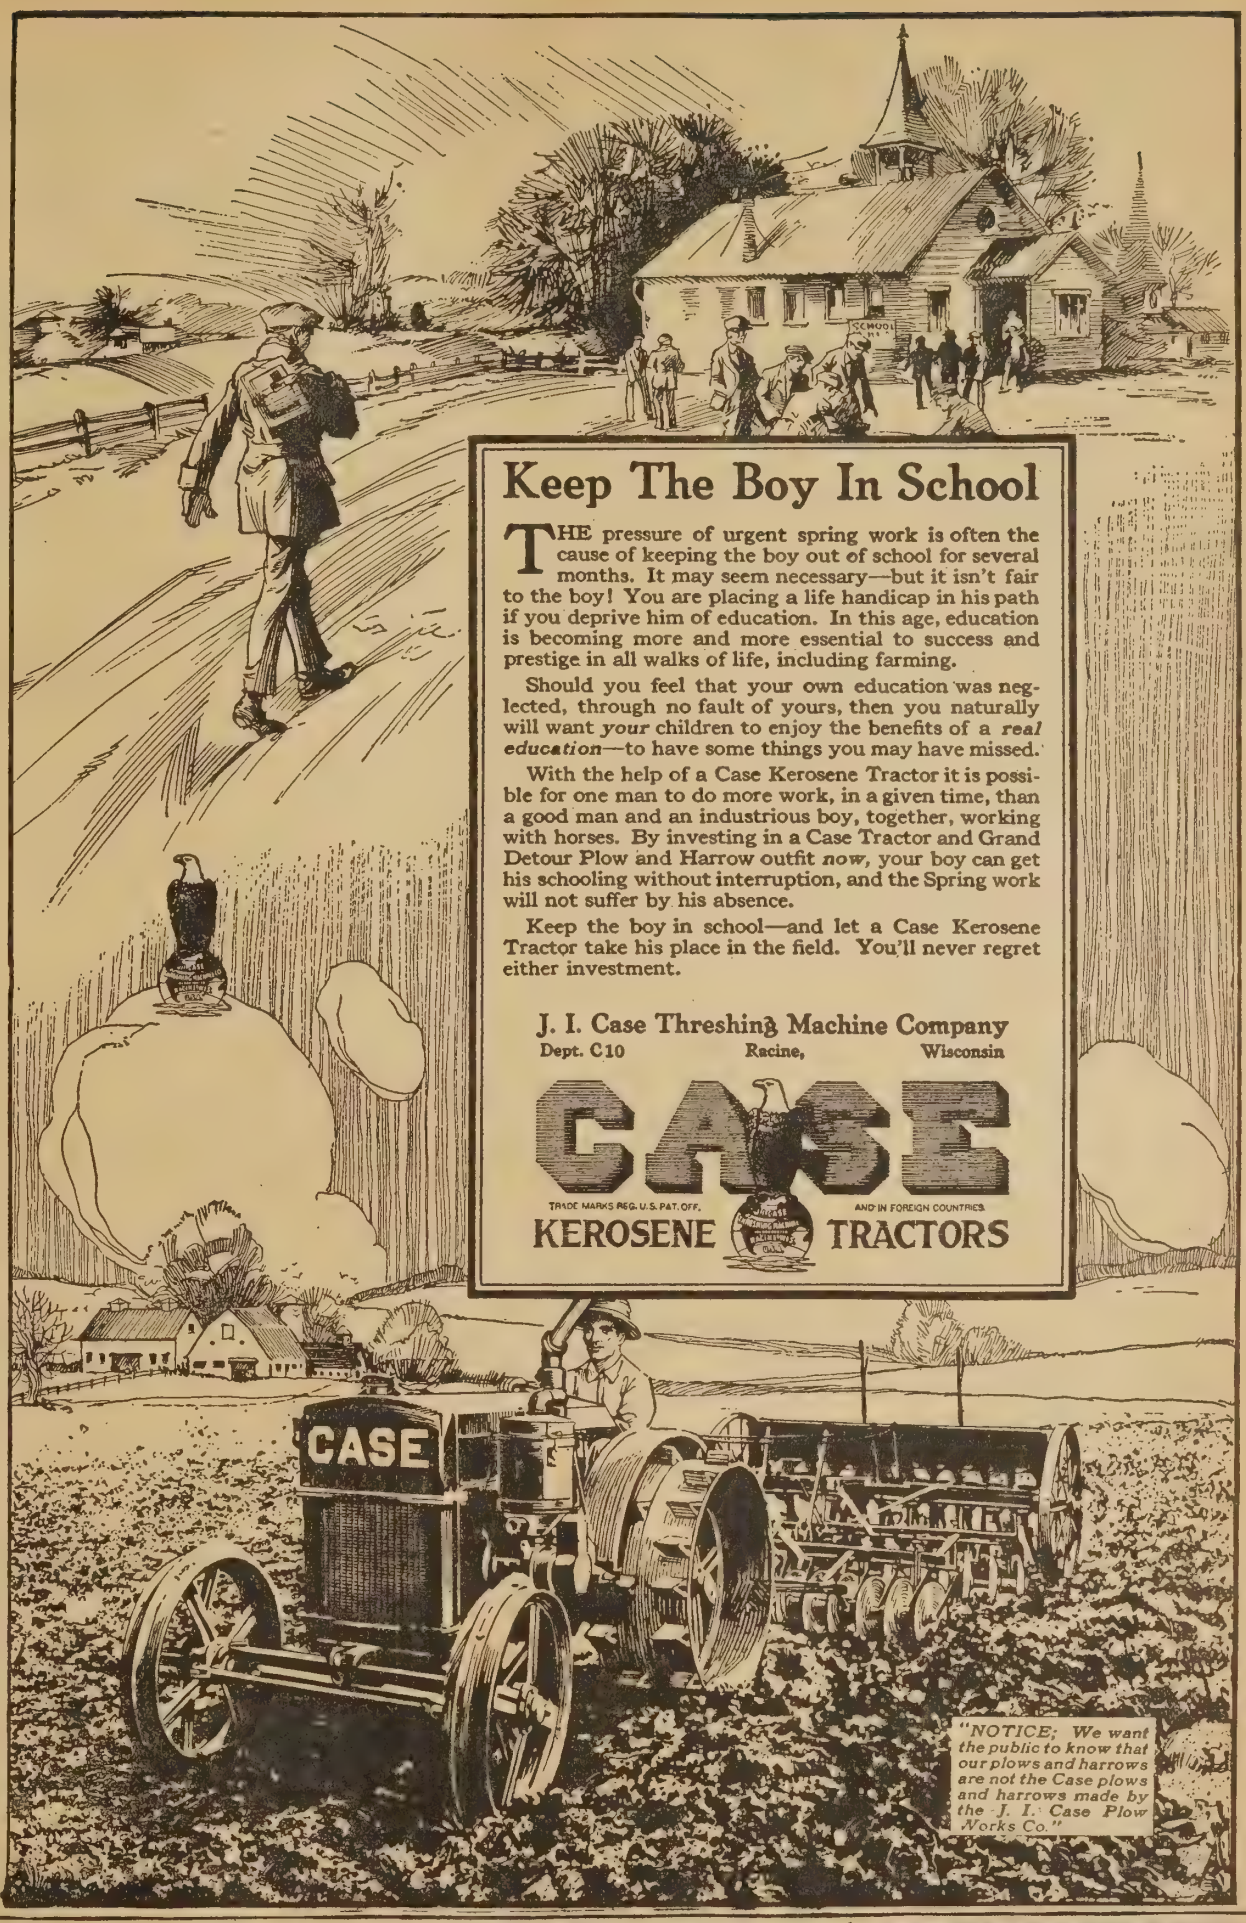
An interesting feature of the creamery's business has been the handling of a limited line of dairy equipment. An agency for two separators is held and the commissions on separator sales last year were sufficient to pay the salary of Mr. Brown. The creamery operates five motor trucks and a first-class automobile for the manager.

Homer Gregory of Payette has been president of the creamery since its organization and has presided at every meeting of the directors of stockholders with the exception of a single meeting since the date of organization and a large part of the success attained is credited to his interest and active assistance in the organization.

One of the first educational projects of the creamery was to co-operate with the farm bureau in the organization of a Jersey bull association in 1919. At that time there were very few pure-bred cows in the county and the average production of the type maintained was low. Four blocks were organized in the association, including fifty members owning 130 cows. Each cow is entered at ten dollars a share. The four bulls were purchased in Oregon and represented excellent breeding. All were from cows that had Register of Merit records of more than 500 pounds of butterfat at maturity.

This feature worked out successfully and so stimulated interest in a better type of dairy stock that last spring the Payette Jersey Cattle Purchasing Association was organized on a co-operative basis. Members borrowed $10,000 on their personal notes through arrangements with the Payette County banks and sent F. R. Cammack, field dairyman of the University of Idaho and a representative of the farm bureau, to Oregon to purchase foundation animals. Forty-three registered Jerseys were purchased. The shipment included bulls, cows, and young heifers and were sold at auction to twenty-two purchasers, practically all of whom were residents of Payette County. The forty-three animals averaged $336, the highest selling for $1,000.

The Purchasing Association found itself with a fund of about $3,000 on hand at the close of the sale, which was used to finance another shipment of pure-bred Jerseys in December. The entire herd of the Glendale Creamery Company, Washington, was purchased and sold at auction for an average of $218. Of the sixty-nine head, fifty-six remained in Payette County, fifty-four of them within a radius of five miles from the little town of Fruitland. In view of the tight financial conditions, the sale was regarded as very satisfactory.



An interesting feature of the sale was the purchase of the Fruitland Bank Calf Club of nine of the best young stock in the sale. The bank loaned funds to boys of the club on renewable notes for one year at six per cent.

Milk Costs in New Jersey

Sussex County, New Jersey, furnishes some comparative figures on the cost of milk production which may be of value to other sections. It is estimated that the cost for keeping a cow for twelve months in 1914 was $146.45. In 1917 this total had increased to $207.47, while the cost in 1918 was $248.27. Subtracting the value of manure and the values of calves sold, these costs were $129.35, $186.37, and $220.58 respectively. In these three years the cost for producing a quart of milk was 4.28 cents, 6.17 cents, and 7.31 cents respectively. The market price in 1914 was 3⅓ cents, or a net loss of nearly one cent per quart. In 1917 the selling price was 4.4 cents, or a loss of nearly two cents, and in 1918 the price was 17.19 cents, or only .12 of a cent below the cost of production.

Nevada Holstein Breeders Meet

The Holstein breeders of Nevada completed a state association November 20th in an organization meeting held at the University at Reno. Eighteen members are enrolled and, according to Secretary V. E. Scott, there is enough interest shown to warrant the prediction that the association will number at least 30 members before another annual meeting.

BULL SALE

Winterthur Farms

Thursday, March 17th, 1921

42 REGISTERED HOLSTEIN BULLS

(From 3 to 17 Months Old)

13 Ready For Light Service

Will be sold at auction to the highest bidder. So come early and look them over before the sale starts.

YOU CAN BUY ONE AT YOUR OWN PRICE and will be able to choose him from among a large number of splendid individuals. Every bull in the sale was born and raised at Winterthur and the dam of nearly every one is now in our herd where she may be seen and inspected at any time.

These bulls are sons of our herd sires: King of the Ormsbys, Sir Inka Prilly Segis, Johanna King Segis, King of the Sadie Vales.

YEARLY RECORD DAMS

35 OF THEM ARE OUT OF DAMS THAT HAVE COMPLETED SEMI-OFFICIAL RECORDS, or that are now making such records. Four have dams with over 900 lbs. butter and 20,000 lbs. milk, two others with nearly 900 lbs. butter and over 24,000 lbs. milk, and seven others with over 700 lbs. butter and from 15,000 to 19,000 lbs. milk. The dams are from some of the best blood lines of the breed.

FEDERAL ACCREDITED HERD

This is an Accredited herd and every bull over six months old will have passed a Federal tuberculin test before date of sale, and will be sold subject to a 60-day retest.

APPROVED NOTES ACCEPTED

We will accept your note for any bull purchased if satisfactory arrangements are made beforehand.

LOCATION OF WINTERTHUR FARMS

The farms are located six miles north of Wilmington on the Kennett Pike. Automobiles will meet trains at Wilmington the morning of the sale.

THORE SEBION, Westby, Wisconsin

Ayrshire Secretary in Scotland

J. G. Watson, secretary of the Ayrshire Breeders' Association, sailed for Scotland January 22nd to attend the annual show of the Scotch Herd Book Society of Ayr and for a study of Ayrshire conditions in the breed's native country. Accompanying Mr. Watson are Mrs. Watson and a number of American and Canadian Ayrshire breeders including Gilbert McMillan, president, Canadian Ayrshire Breeders' Association; William Hunter of Alta Crest Farms, Massachusetts; and R. R. Ness, Quebec. John Lindsay of Wendover Farm, New Jersey, and John Cochrane of Barclay Farms, Pennsylvania, are also in attendance at the Scotch show.

1920 Farm Wages Highest

The highest farm labor wages ever paid were those recorded in 1920. According to the United States Department of Agriculture the average monthly wage for labor by the month was $46.89 with board and $64.95 without board. For daily labor at harvest, $3.60 with board was paid and $4.36 without board. The increase in farm wages began about 1895. At that time the average monthly wage was $17.69. In no other previous year, in records which extend back as far as 1866, is a lower rate than that recorded, except in 1879 when the average was $16.42. By 1902 the wage rate had increased to $22.14, by 1914 to $29.88, and in 1915 to $30.15. These increases came before the effect of the war. A rapid rise followed the beginning of the war, the average in 1916 being $32.83, which increased year by year to 1920, when the highest price in the farm history, $64.95, was reached.

Spray every fruit tree in 1921.

Elkhart County Guernsey Breeders'

Second Annual Consignment Sale

March 17

Goshen, Indiana

38 Registered Females
10 High Class Bulls

Including:

15 good cows, 23 bred and open heifers. These females are a choice lot backed by good A. R. ancestry. Many of them are by A. R. sires and from A. R. dams.

3 aged bulls, 2 young bulls ready for service and 5 younger bull calves. These bulls are sons and grandsons of such sires as May King's Vrangue of Ingleside, King of Chilmark and Glenwood Boy of Haddon. One is an A. R. bull, the others have good A. R. dams.

These animals would be a credit to any herd. The sale offers you an excellent opportunity to buy foundation females or a good herd sire. Every animal will be tuberculin tested and guaranteed a breeder. Write for catalog, look it over and come to the sale.

Wakarusa, - Indiana

"Get" of Pencoyd's Secret Marose

This bull won first prize, senior and grand championships at the New England Fair, Connecticut and New York State Fairs. His "get" (4-mo.-old calves) was first at The Eastern States Exposition and fourth at the National Dairy Show with thirteen "gets" shown. His heifer calf, Appletree Point's Dolly Dimple, was Junior Champion at New England Fair, first prize at Eastern States Exposition, and was Junior and Grand Champion female at Connecticut State Fair. His bull calf was unbeaten in all eastern shows and won at Waterloo and National Dairy Show. Write for prices on May Rose calves that combine type and production.

U. A. Woodbury, II Burlington, Vermont

For Sale—A Bull Calf of Real Merit

Dropped Aug. 28, 1920, and Sired by **Langwater Cavalier 21012,** whose daughters have put him to the front as one of the great bulls of the breed. His highest record daughter made 734 lbs. fat in F.

The dam of the **Bull Calf** is Georgette of Edgemoor, who is on test and is a daughter of Mildred II of Les Godaines (55120), who was the **Grand Champion** Cow at the **National.** Her record is 14,890.9 lbs. milk, 702 lbs. fat. Her daughter **Century Girl** was first prize two-year-old.

The **Bull Calf** is a fine individual and splendidly marked. Send for extended pedigree and full description.

A few choice females to offer.

CONTENT'S MERRY BOY OF PROSPECT 64022

Dropped Dec. 23, 1919

The above picture very poorly represents Merry Boy. He is a regular bull calf—full of life and vigor. His conformation is the kind that pleases a close observer. He is straight and wide. His barrel is of good length and his depth is especially noticeable. We know that his purchaser will be more than pleased with him.

He is sired by ANTON'S KING CONFIDENCE 43517, our senior herd sire who traces six times to May Rose 2nd. The dam of Anton's King Confidence has a record of 764.65 lbs. of fat as a junior 4-year-old.

His dam is Content of Prospect A. R. 5960. She is one of the most persistent producers we have in the herd. She easily made the A. R. and is the kind of a cow that always makes good money for her owner. If you want this bull calf write

New Jersey's Dairy Cattle

The annual report of the New Jersey Department of Agriculture gives some pertinent facts concerning the cow population of this state. The live stock census report indicates a very slight increase in the number of dairy cows in the state since 1912, when there were 150,000. During the three years following, there was reported to be 4,000 less while in 1917 there were 155,000. In 1921 there was estimated to be 151,000. The average value of the milk cows of New Jersey in 1912 was $53. There was a considerable increase year by year until 1920, when the average value was placed at $128. The figure given for 1921 is $110. The decrease in average price, when considered on the basis of total number of cows, is a difference between the valuation in 1920 of $19,328,000 and in 1921 of $16,610,000.

Agriculture is the greatest among arts, for it is first in supplying our necessities, it is the mother and nurse of all other arts; it favors and strengthens population, it creates and maintains manufacturers; gives employment to navigation and materials to commerce; it animates every species of industry, and opens to nations the surest channels of opulence. —MACNEVEN.

4 Holstein Bullsfor Sale

All by King Segis Pontiac Cor-Will, 190512, whose sire is King Segis Pontiac, 44444, and whose dam is an A. R. O. daughter of Pontiac Korndyke. Also two fine young registered cows, one a granddaughter of Pontiac Korndyke. Wm. N. Osborn, Wanatah, Ind.

Our Record Bears The Stamp of Approval

For over thirty years River Meadow Farms have supplied high producing cattle to discriminating buyers. Many of them are still regular purchasers. Courtesy and consideration for our customers' interests give us new friends daily.

We are able to offer very favorable prices on grade and pure-bred heifer calves for quick delivery, from high producing dams by sires bred for type and production. With the present shortage of dairy cattle, no investment will increase in value as rapidly and surely as these calves. If desired, we can supply a pure-bred bull calf to go with them. For an immediate reply, address

RIVER MEADOW FARMS, Portlandville, N. Y.

Holstein Service Bulls

sired by

The Second of A Noteworthy Series
— *Make Your Plans to Attend*

PABST SALE
SURPLUS ANIMALS
APRIL 2ND

Pabst King Pontiac Lad will be sold. He is one of our herd sires. He is a son of Pabst Hengerveld DeFreule that has just made over 39 lbs. in 7 days. He is a full brother to Pabst Champion DeFreule that has just made over 37 lbs. in 7 days and 151 lbs. in 30 days. We have 49 of his daughters in our herd and 30 cows safely in calf to him. He is the highest record son of King Pontiac Champion ever sold. His breeding and individuality should place him at the head of some great herd.

28 Young Bulls—15 Cows

Young in the sale will include some of the very best we have ever bred, including fifteen by Creator and nine by Pabst King Pontiac Lad. Practically all these bulls are from splendid record dams that will have greater opportunities. One son of Creator is from a 29-lb. and almost 900-lb. daughter of "Champion," another is from a 21-lb. 2-year-old daughter of Champion Dora Korndyke, champion Holstein cow for two consecutive years' production, another is from Pabst Ivy with 34.21 lbs. in 7 days and a good yearly record, another from Pabst Kinnickinnic with 35.50 lbs., twice over 34 lbs. and three times over 32 lbs.

29 bulls of this class will be sold.

The fifteen young cows and heifers in this sale will furnish an excellent opportunity to procure desirable foundation cows, in calf to good sires. Practically all of milking age have records, are from good record dams, by noted sires and in calf to one of our herd bulls. Seven of them are in calf to Creator. Never before have so many been offered in calf to this great sire. There will be daughters of Maplecrest King De Kol, Woodcrest Clyde, King Pontiac Champion, King Pietertje, Pabst Pontiac Hengerveld and Korndyke Segis Johanna.

Remember that Pabst Stock Farm won first place last year as breeder of prize winners. The animals it sells to others make good for them. In buying at this sale you buy the blood that is represented in many of the prominent herds.

Be sure to get your name on the catalog list now and send for full information on this sale. It is our second semi-annual.

BUY DIRECT
Reasons for Buying Holstein Cattle in Waukesha County:

1. You can buy direct from the breeder through the breeders' association, organized by the breeders to promote the breeding of more and better Holstein cattle and to assist in a fair marketing of the same.
2. There are over 50 pure-bred Holstein sires in service in Waukesha County whose dams have records of over 30 lbs. butter in 7 days or 1,000 lbs. butter in a year.
3. There were 1,307 long-distance tests made on Holsteins in Waukesha County during the past year, which is more than the total in the next four leading counties in the state.
4. There are more tuberculin tested cattle in Waukesha than in any other county in the world.
5. The breeders' organization is in a position to put you in touch with "bred-for-production-stock" at reasonable prices.
6. When buying through the Association, you obtain the services of men who devote their entire time to the Holstein industry. It saves you time. You get more for your money.

THE MARK OF QUALITY

A *Real* Herd Sire

This nine-month-old Bull, KING HENGERVELD KORNDYKE EUREKA, will fit someone's herd. He is the product of the most careful breeding.

The Sire, Sir Ormsby Hengerveld Korndyke, a 35-pound bull, grandson of the sensational Hengerveld De Kol with 116 A. R. O. daughters, has been carefully line bred in the Ormsby, Hengerveld, Pietertje lines with a sprinkling of De Kol.

The Dam, Eureka Melissa Segis, is by a full brother to King Segis Pontiac Count, sire of eight daughters with records over 1,000 lbs. Eureka Melissa Segis herself has a 7-day record of over 21 pounds as a two-year-old and is finishing up her year's record with over 750 lbs.

To some progressive breeder with the proper kind of herd we will sell this bull at a reasonable figure. Correspondence is welcome, but come to the farm at Blooming Prairie if you can and see him.

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

Sir Walker Segis Homestead

The best show bull and son of the great bull, PIEBE LAURA OLLIE HOMESTEAD, out of a "COUNT" daughter, BEAUTY BEETS WALKER SEGIS, world's greatest heifer, with two yearly records over 25,000 lbs. milk and 1,000 lbs. butter in heifer form, and a seven-day record of 35.03 lbs. butter from 730 lbs. milk.

We offer several choice bulls, one month to a year old, out of high yearly record and A. R. O. cows, at very reasonable present day prices. Pedigrees and photos will be sent.

A. J. LASHBROOK, - - - Northfield, Minnesota

COME TO BISCAY

your next purchase of pure-bred or grade Holstein le, mature or young stock. Large selection, also a select male calves to offer. Located near station

KAY SALES CO., BISCAY, MINN.

Lake Shore Farm

Offers May 22nd, 1920, bull calf. 795 lbs. butter over 20,000 lbs. milk is his dam's yearly record. King Segis breeding, light color. Price for January $250.

E. J. OPPLIGER, Box 20, Forest Lake, Minn.

Sons of "COUNT"—

—"The Marvel of All Sires"

Whose daughters have broken more World's Records than the daughters of any other sire of the breed in both long and short time work. He has eight 1,000-lb. daughters.

Sons of "PIEBE" — "The Present Day Sensation"

The only bull in the world with five 20,000-lb. two-year-old daughters.

Sons of "COUNT" from daughters of "PIEBE"
Sons of "PIEBE" from daughters of "COUNT"

We have the finest line of young bulls we have ever raised at ARDEN FARMS, priced in accordance with present financial conditions. LIBERAL TERMS GIVEN IF DESIRED. Write me for particulars.

J. M. HACKNEY

602 Merchants Bank Building, - - - St. Paul, Minnesota

Bull Calves of Ormsby Breeding

from A. R. O. dams for sale, 2 to 8 months old. Prices $200 to $1,000. We can also offer several good, typy cows bred to a good Ormsby bull. Write or come and see us.

MINERAL SPRINGS STOCK FARM, - - SAVAGE, MINNESOTA

Stuart—McIntyre—Hansen, Owners.

Address correspondence to Axel Hansen, formerly with John B. Irwin.

Serviceable Sons of Dutchland Aaggie Tidy Prince

I have three of these youngsters for sale, all ready for service and from A. R. O. granddaughters of S. P. O. M. Their sire is from a sister to Tidy Abbekerk Prince and already has a good list of tested daughters, including one above 36 lbs.

Write today for complete information.

E. J. BROSIOUS, - - Stillwater, Minn.

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams.

For pedigrees and prices, write

O. J. GROVER, - - GLYNDON, MINN.

Grandsons of

Duchess Skylark Ormsby and of S. P. O. M. 38th.

for sale. These youngsters are from A. R. O. dams that are now making good yearly records. Write today for further information.

POPLAR HOLLOW STOCK FARM,
Bertram D. Scott, Prop., Richfield Station Minneapolis, Minn.

Bull Calf

advertised last week is sold. Here is another good one ready for light service. Sired by a 30-lb. bull. Dam a 14-lb. 2-year-old who will be tested again next spring. Priced so reasonable that you can't afford to be without him. $150.00 for immediate sale.

V. R. Holmes, Anoka, Minn.

WE HAVE

The Nicest Lot of Calves

By "Fayne Star" that we have ever had to offer. They are mostly white and are good individuals. We are pricing them worth the money. Get our bull circular. It is free.

Flecks Farm, Faribault, Minn.

Get A Calf

We have a grand bunch of youngsters on hand. Come and pick out a calf while you have a big choice. Grow him to suit you. Saves you money and we are selling them as cheaply as we can. Show calves that are backed by generations of official testing and careful breeding. Sons of DUTCHLAND CREAMELLE COLANTHA LAD No. 165049. His yearly daughters all average over 834 lbs. of butter at 26 months of age.

GRAHAMHOLM FARMS,
H. R. Searles, Mgr., Rochester, Minn.

Sir Korndyke Ormsby De Kol 15th—21 Months Old

His sire is a son of Sir Korndyke Hengerveld De Kol; 51 A. R. O. daughters, one of whom has a 7-day record of 39.56 lbs. and several above 1000 lbs.

His dam has a record of 23.778 lbs. and now on yearly test.

Geo. H. Elwell, - Minneapolis, Minn.

HOLSTEINS—Females

We offer some very choice females, all ages, priced very reasonable. Mostly bred to our 34-lb. bull, Piebe Count Corn. One or a carload.

BLACK AND WHITE STOCK FARM,
Route 3, Melrose, Minnesota

Holstein Bulls

At Farmers' Prices

We are not in the game to get rich but to help promote the breed by offering pure-bred bulls at the lowest prices, enough to cover raising. Write for prices and descriptive list. The Ormsby kind.

RAMSEY COUNTY HOME,
J. E. McMahon, Supt., North St. Paul, Minn.

Mankato Holstein Farms

Offer a Son of

King Colantha Ormsby Bess

A Sir Pietertje—Bess Burke combination. Nine dams average over 1,000 lbs. Dam is by a brother to Pietertje Maid Ormsby. 894 lbs. butter and 21,833 lbs. milk last year. Running at a world's record gait for the year. Over 400 lbs. butter and 10,000 lbs. milk first four months. Several bulls at prices warranting their use in grade herds.

Write or better still come and see them

(Herd under State and Federal Supervision)

Marlow & Randall, Mankato, Minn.

RICHLY BRED

HOLSTEIN BULL CALVES

out of A. R. dams and sired by our two richly bred herd sires — **King Piebe Ormsby Mercedes**, a 35-lb. son of Sir Korndyke Bess and every dam in pedigree over 22 lbs. and **King Pietertje Mercedes Ormsby**, a son of Sir Pietertje Ormsby Mercedes and out of a 19-lb. senior two-year-old dam.

Herd tuberculin tested. Write for information or visit herd.

P. FROST SPAULDING FARM CO.
C. L. Spaulding, Mgr., Warren, Minn.

Richly Bred Ormsby Bulls

From Yearly Record Dams—Age 1 to 14 Mos.

Six three-year-old heifers in my herd (under ordinary farm conditions) have just finished yearly records averaging 722 lbs. butter from 16,639 lbs. milk. To make room for calves now coming on, am offering at bargain prices three grand individual sons of above cows ready for service. Act quick. Herd under Federal Supervision.

F. A. STILLINGS, Frazee, Minn.

BULL CALF

Sire's dam, butter, 1 yr., 848 lbs.; her daughter, 1,055 lbs. Grandsire's dam, 987 lbs. at 11 yrs.; her full sister, 1,344 lbs.; another, same dam, 1,322 lbs. Dam, Miss Pietertje Alexina 3d, sister to Miss Pietertje Alexina 2d, 1,290.91 lbs. A dandy calf, priced right. Write quick to

McKAY BROS., - - CADDOA, COL.

Would you feed her a Feather Bed?

Why wouldn't feathers make a good concentrate? They contain as high as 85% protein!

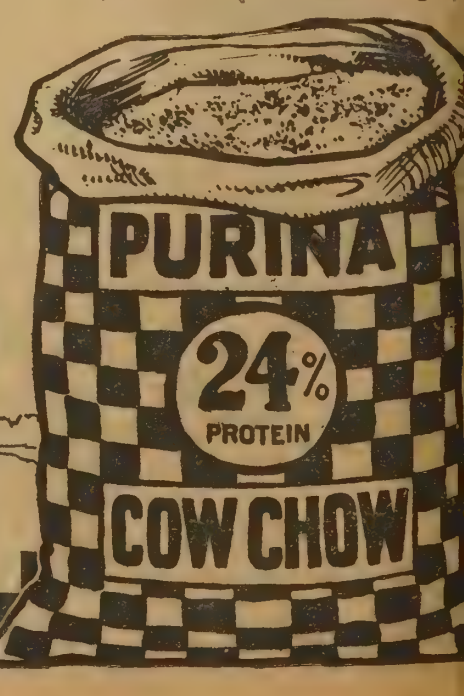
YOU can't make milk out of feathers because the protein in them is practically all one kind, the same as that found in hair, horns and hoofs. Milk requires very little of such protein. As there are hundreds of different proteins, the selecting of the right kind is important.

Right Kind of Protein Added to Grains Makes Them Worth More

By adding Purina Cow Chow to your home-grown grains, you supply the proteins needed in milk. Without it, you will feed twice as much grain as your cows need, and still will not get all the milk they can produce. That is because grains are deficient in milk-making protein and why you will find feeding

Purina Cow Chow Pays Any Time

It's hard at a time like this to really make up your mind to feed as you know you should, but it pays. Getting more milk at less cost per pound and lengthening the lactation period by supplying milk-making protein, which would otherwise be drawn from the cow's system, are just two of the advantages of feeding Purina Cow Chow.



RALSTON PURINA COMPANY ST. LOUIS, MO.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Fort Atkinson, Wisconsin Volume LXI, No. 8 March 11, 1921

James Equipment Makes Barn Work Easy

IN the barns that are James equipped, labor is not a problem; for James Equipment makes barn work easy. James Equipment not only cuts labor in two, but makes it possible for children to do work that without James labor-saving devices would require a man's strength; chore time becomes almost play time for boys who work in the barn.

Cleaning The Barn

The easy running James Carriers turn the disagreeable, dirty task of cleaning out the barn into a near-pleasure. They make a boy's job of what used to be shirked by all—and are an investment that pay profits of 25% or more a year in labor saved.

James Scrapers make quick work of cleaning cement floors; the James Stanchions, with the James Alignment Device, keep the stalls and cows clean, by aligning the cows at the rear, so that manure falls in the gutter and not on the platform.

Feeding The Cows

The easy way of feeding the cows is the Jamesway—the James Feed Truck or Feed Carrier, and James Feed Mangers. Rolling easily along the track or on the cement floor, the James Carrier or Truck make unnecessary the lifting of heavy baskets filled with feed. With their big, roomy tubs they save much walking to and from the feed rooms, and in a short time pay for themselves in labor saved.

Watering The Cows

Water — the simplest means of increasing milk yields — is often disregarded by dairymen. Those who realize how greatly milk flow is increased by James Cups are reaping huge profits on their investment.

Reports based on milk records of 28 herds (739 cows) for instance, show an average increase per cow per day of 2.45 lbs. This is 490 lbs. in 200 days, which at $3.00 per cwt. totals $14.70; with a saving of $2.50 per cow in labor and 55c in fuel. That's a profit of 400% the first year.

Other reports and other investigations confirm these figures. Ask us for the proof. Then get James Cups busy right away making these big profits for YOU.

Free Dairy Barn Book

The 320-page book—"The Jamesway"—tells all about the James inventions that save so much of labor, prevent spread of disease, promote better cow health, protect against dangerous bulls, make simpler the care of calves and sick cows, and increase milk yields.

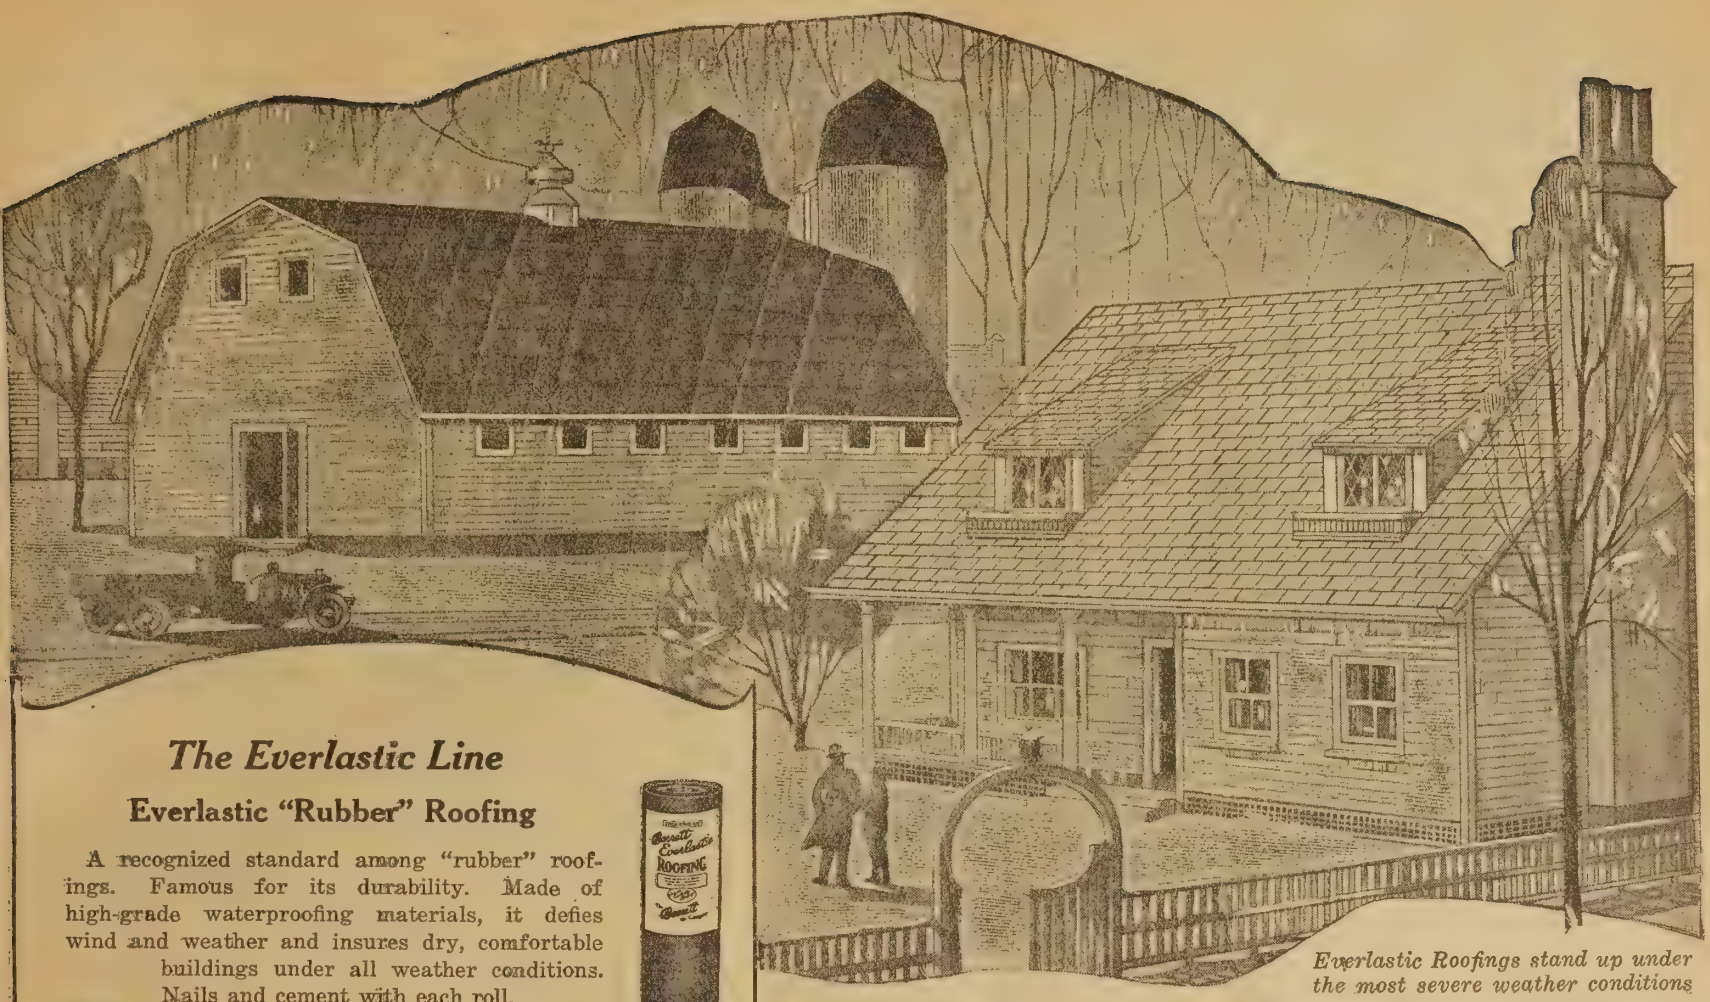
Jamesway Barn Plan Service

What a barn costs depends in no small degree on the care with which it is planned in advance.

The man who has plans completely worked out and blue printed, can submit them to several contractors, accepting in safety the lowest bid because all are bidding on exactly the same proposition.

Contractors and those supplying materials are held to exact requirements; substitution of inferior materials or workmanship is prevented; wastes and expensive "extras" are avoided; misunderstandings are unlikely.

In the James organization are scores of Barn Planning Experts, whose experience and help are yours for the asking.



The best of their ideas are in a 320-page book on barn building, remodeling, ventilation and equipment; this book sent free.

Write us now. Tell whether you expect to build or remodel this year; say what barn problems are bothering you. Perhaps we can help you solve them.

If you want the book, ask for *"The Jamesway Book, No. 23."*

James Manufacturing Company

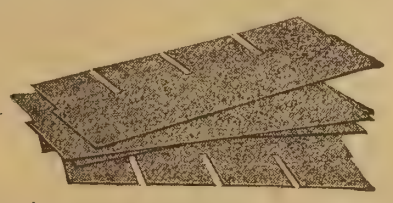
Fort Atkinson, Wis. Elmira, N. Y. Minneapolis, Minn.

Everlastic Roofings stand up under the most severe weather conditions

The Everlastic Line

Everlastic "Rubber" Roofing

A recognized standard among "rubber" roofings. Famous for its durability. Made of high-grade waterproofing materials, it defies wind and weather and insures dry, comfortable buildings under all weather conditions. Nails and cement with each roll.

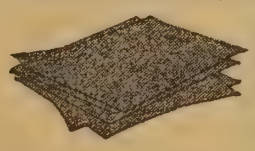


Everlastic Slate-Surfaced Roofing

A high-grade roll roofing, *surfaced with genuine crushed slate*, in two natural shades, red or green. Needs no painting. Handsome enough for a home, economical enough for a barn or garage. Combines real protection against fire with beauty. Nails and cement with each roll.

Everlastic Multi-Shingles

(*Four-Shingles-in-One*)



Made of high-grade thoroughly waterproofed felt and *surfaced with crushed slate* in beautiful natural slate colors, either red or green. Laid in strips of

four shingles in one at far less cost in labor and time than for wooden shingles. Give you a roof of artistic beauty worthy of the finest buildings, and one that resists fire and weather. Need no painting.

Everlastic Single Shingles

Made of the same durable slate-surfaced (red or green) material as the Multi-Shingles, but cut into individual shingles, 8 x 12¾ inches. Laid like wooden shingles but cost less per year of service. Need no painting.

Two Ways to Know Good Roofing—

You can find all sorts of plain-surfaced "rubber" roofing on the market. Some are good, some fair, and some practically worthless. All look alike when new.

But you have two ways of telling whether roofing is good.

One way is to put it on your building and see how it wears. But that's *hindsight*—a costly method, if the roofing *isn't* good.

The second way is the simplest and the safest. *Be sure that the label bears the name "Barrett Everlastic."* That's *foresight*—proof-positive of a moderate-priced roofing, good for many years of satisfactory, economical service.

For behind every Barrett Everlastic roof stands the reputation for dependability cherished by The Barrett Company for over fifty years.

There's a style of Everlastic for each one of your farm buildings. Roll roofing, plain surfaced, or covered with red or green crushed slate. Shingles—single or in strips of four—and slate-surfaced in red or green.

Illustrated booklets describing each style free on request.

Chart of Recommendations *for* TRACTORS

(Abbreviated Edition)

How to Read the Chart

THE correct grades of Gargoyle Mobiloils for tractor engine lubrication are specified in the Chart below.

A means Gargoyle Mobiloil "A"
B means Gargoyle Mobiloil "B"
BB means Gargoyle Mobiloil "BB"
Arc means Gargoyle Mobiloil Arctic

These recommendations cover all models of tractors unless otherwise specified.

Where different grades of Gargoyle Mobiloils are recommended for summer and winter use, the winter recommendations should be followed during the entire period when freezing temperatures may be experienced.

This Chart is compiled by the Vacuum Oil Company's Board of Automotive Engineers, and constitutes a scientific guide to Correct Tractor Lubrication.

If your tractor is not listed in this partial chart, consult the Chart of Recommendations at your dealer's, or send for booklet, "Correct Lubrication for Tractors," which lists the Correct Grades for *all* Tractors.

The Decisive Year

Utmost economy will help you over it

IN answer to the universal cry for production, most American farmers invested their profits to render their farms more efficient. Many of them drew heavily on future profits.

Today prices have dropped. Bankers are calling loans and restricting credit. Many farmers view the future with anxiety.

These conditions are temporary. Food is a prime necessity. Authorities state that it is a question of weathering safely the next year.

This can be done by the utmost economy.

Soon the plowing will begin. Your tractor will daily need gallons of fuel and its ration of oil. Gargoyle Mobiloils when used as specified in our Chart of Recommendations mean dollars and cents saved because they mean gallons of fuel and oil saved. At the height of the season, time is of utmost value. The tractor which unexpectedly breaks down eats up money. Men lose time. Repairs and parts must be paid for. The delay itself often affects crops. The correct grade of Gargoyle Mobiloils helps your tractor to stay in harness when you most need it.

Cheap oils are a waste of money. True, they cost less. But the poor lubrication they supply is often a vital factor in shortening the life of machinery. Cheap oils steal the power your tractor needs for pulling. They cause mostly breakdowns and excessive repair bills.

In hundreds of public and private tests Gargoyle Mobiloils have shown a saving of oil from 50% to 70% and a fuel economy from 17% to 25%. The Vacuum Oil Company was the first to supply petroleum lubricants to automobiles and has ever since been recognized as the leaders in the science of lubrication throughout the world.

Gargoyle Mobiloils will give you utmost economy in the lubrication of your most valuable equipment—tractors, trucks and automobiles.

At the end of the year this means a tidy sum of dollars and cents saved.

The chart shown here indicates exactly what grade of Gargoyle Mobiloils will give you best engine results from your tractor.

Mobiloils

A grade for each type of motor

In buying Gargoyle Mobiloils from your dealer, it is safest to purchase in original packages. Look for the red Gargoyle on the container.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXI — FORT ATKINSON, WIS., MARCH 11, 1921 — Number 8

The 20th Amendment

HELEN S. K. WILLCOX, NEW YORK

"THE 20th amendment! No, it wouldn't be Blue Sunday or abolishing cigarettes or the movies or taking a whack at the too-low cost of 1921 living or anything like that," said a well known dairy farmer bitterly the other day. "I'll let the real dyed-in-the-wool reformers put these things across if Congress is so minded, but if I were the honorable law makers of this country, I'd sure do my dumdest to pass a 20th amendment prohibiting my dairy brethren from buying and using oleo on their own tables. If I were Congress, I'd do that, by gum."

"Got a little grouch, ain't you, John?" slyly inquired another in the group. "Who's gone and got your butter-goat this morning?"

"Goat is right," retorted John grimly, "and I don't ever expect to recover mine until the cocoanut cow has ceased to be worshipped by two or three million fool farmers who prate about 'their rights to use oleo' and such knock-kneed arguments. Honestly, their pious reasons for undermining their own industry while taking the part of the poor and maligned oleo fellows is enough to make a self-respecting dairyman see red. It ain't natural, nor right, nor anything else human. What ails such flesh and blood folks, anyhow?"

"Well, one man says the butter he buys is so poor and the oleo his wife mixes up with some orange dye is so good that he can't bring himself to go back to Number 1 after sampling Number 2. That reason will hold water, won't it, John?"

"All bunk!" returns John briefly, "although it's a fact we can't disprove that American butter is not what it might be. But you'd see quick enough that if oleo cost what butter does and was made of the same decent ingredients that butter is, so that its cost would necessarily have to compete with butter, you'd see, I say, that this loud chatter about poor butter and good oleo would die out over night. You know how these oleo eaters work. There are at least 57 brands on the market, some specializing in various nut oils and others in more or less doubtful animal oils and left-overs, and the oleo enthusiast has the time of his life shopping round among em all, seeing which he likes the best including both price and flavor. He can't do that where butter is concerned, because butter is all made more or less alike, complying with the same standards, made from the same wholesome fat-o'-the-cow and in most other respects being just what it seems—which oleo ain't by a long shot. The oleo eater thinks it's great fun to try out the 57 brands and so he buys every new brand he hears of and helps the good work along amazingly. He enjoys making up his mind and that of his family as to whether they prefer grease made of cocoanut oil, or cottonseed oil, or peanut oil, or palm oil, or some dozen other varieties of tropical oils gathered by the heathen coolies and sent up here to the United States in a magnanimous endeavor to drive prosperity away for all time from the old farm. Yes, sir! these farseeing farmer-consumers of imitation butter smack their lips with gusto over the sweet taste of their precious pet, then go out and bed down the poor old scrubs, take the stuffin' out of the wife because she wants another quarter to keep house on for the next year, and holler and take on because milk ain't worth a tinker's dam lately and the dum distributors and condenseries and so on are stuffing us about a surplus. Say, friends, know such a feller?"

"Yes, you've said something, John," responds a third with some heat, "and your human example will do to shake up in the same basket with our dairyman-friend who doesn't give a continental about the flavor, but who looks at the price tag on a pound of "oly" and sees that it cuts butter by practically half and sometimes even two-thirds. This old fox figures in his dark, two-by-four mind that there's some difference between butter at 56 cents a pound and oleo at 34 cents. Therefore him for the latter—every time. He's the kind of leading citizen that sets his barns and stock on fire in order to draw down a good insurance wad. He's meaner and tighter with his wife and kids than the tightest bark that ever grew on earthly tree, and if he knew that by abstaining just one day from oleo and buying a pound of butter to eat in its stead he would thereby save the entire dairy industry, he'd just gloat in refusing to do it, and would go down to ruin himself before he'd see right or reason. Yes, sir! There's more such mean men than you'd think for, and the more you argue with 'em, the less they will care or be convinced. Such benighted brethren ought to move bag and baggage to the South Sea Islands and get oleo for nothing at its source. They're a menace and a pest to the whole dairy world."

"Well, now, you'd think that owners and breeders of registered stock would be above boosting the other fellow's product, wouldn't you?" interrupted a listener at this point, "but I've had the supervisors of tests tell me that more than once they've sat down at some big breeder's table on which queened the omnipotent oleo. Must be such fellows come in the same category as the class you would consign to the South Sea Islands, or was it a hotter place?"

"Say, but I'd hate to have a tester spread such news about me," John broke in with a grin. "Bet it would hurt me a thousand times more than the few cents they kid themselves they save on a pound. And, speaking about saving when a farmer uses oleo, I wonder if such reasoners have brains enough to absorb about now that the low price of milk is very directly traceable to their oleo adherences. If oleo were only used by the poorest classes in the cities, for which it was first designed, and if the farmers hadn't gone over to it along with a goodly number of regular butter consumers, it's as plain as the nose on your face that butter and not oleo would be enjoying life just at present and that it could easily take care of any milk surplus now existing. In other words, if three-quarters of us Americans ate butter exclusively, we dairymen would have to hump some to make the milk to keep it coming. But, seeing as conditions are exactly reversed, we are dumping our milk on the ground or in the brook or feeding it to the hens and cursing the Dairymen's League and the various milk associations for not selling it all at $3 and up per hundred. Oh, we're a consistent lot of intelligent reasoners, we are! Can you blame me for wishing I were in Congress for about two minutes—just long enough to do to oleo what they're going to do to home brew some day?"

"It's enough to make a minister swear," agreed one and all gloomily. "Yes, and don't criticize the anxious consumer and the moat in his eye untill we have removed the beam in our own," advised a fourth farmer with deep disgust. And that last statement is one to ponder well.

They say that in New York State, in a little village with a population of 700, there is, in its near vicinity, more pure-bred Holsteins kept than in any corresponding section in the United States. Down there they breathe, eat, sleep, and think dairying. A certain butter investigator entered a store in this village one day and noticed a farmer carrying out several packages of oleo with his usual purchases. The store keeper was thereupon asked how much of the stuff he sold annually, to which he replied, "It's a trade secret, but we don't make any effort to sell it. We try to sell butter."

"Well, how much

THE SWISS COW IN ITS NATIVE LAND

Simple Ways of Feeding Dairy Cows

H. P. DAVIS, IDAHO

DAIRY cows, like human beings, must be properly fed and cared for to always be in good humor and good health. Satisfactory living conditions and proper handling play no small part in keeping dairy cows feeling fit. Even more important in obtaining profitable production is satisfactory feeding; satisfactory in that the greatest production is obtained at the least cost without impairing the future usefulness of the animal. Feeding is both an art and a science. Present day practices are based upon fundamental research in chemistry and physiology, modified by the careful observation of thousands of feeders during many decades. Attempts have been made to reduce the science of feeding to a few absolute rules, but these have met with failure. Rules are very useful guides, but the feeder must constantly observe his cows and study their likes and responses if he is to obtain any considerable measure of success.

Liberal Feeding Necessary

Successful feeding is also economical feeding. Never must the cow be "stinted". She should be provided with an abundance of palatable and nutritious feed. There is no greater false economy than limiting production through failure to supply the cow with plenty. Liberality in feeding is economy. It is not meant that cows cannot be overfed but that they should be so fed that they produce with the greatest economy.

Cows frequently are likened to various machines and the comparison is applicable. Take the gasoline automobile, a certain amount of gasoline or fuel is needed to keep the engine running even when the machine is standing still doing no work. If only enough fuel is supplied to keep the engine going, the automobile will not move. Only when gasoline is furnished above the quantity required to move the engine, is the automobile useful. Just so, a certain amount of feed is necessary to keep the cow's body operating. This is called maintenance. Until this quantity is supplied, the cow cannot be expected to perform useful work in the form of producing milk. It is true that the specialized dairy cow will often produce milk when fed below her maintenance requirements, but she does it at the expense of her body. The feed supplied above the requirements of maintenance is that used for milk production. The average cow uses about sixty per cent of the feed for maintenance, while the high producer uses a very much smaller proportion. Maintenance seems to be directly proportional to size. That means that the maintenance requirements for two cows of the same weight are equal. The economy of the large producing cow is therefore very apparent.

Type of Dairying Influences Feeding

Much depends upon the kind of dairying carried on as to the feeding to be employed. There are two main types with various intermediate stages between the two. They may be designated as summer dairying and winter dairying. In summer dairying the cows freshen in the spring, and throughout the summer until late fall are on pasture. By winter the larger part of the milking period is past and the cow is given a little hay, but soon turned dry. In winter dairying cows freshen in the fall and, for a goodly share of the lactation period, are fed in the barn, although perhaps turned out to pasture in the spring or summer. In summer dairying pasture grasses supply most of the feed while in winter dairying they play but a small part.

Summer Feeding

Usually feeding in summer consists of the use of pastures although soiling crops are gaining favor in certain localities. Oftentimes it is desirable or necessary to supplement such feeds. Occasionally it is not possible to have pasture which will furnish any appreciable part of the ration and, in such cases, summer feeding does not differ materially from winter feeding.

In many ways, the common pasture grasses are the best and most satisfactory feed for the dairy cow. They are succulent, juicy, and contain the necessary food material for carrying on the body functions and producing milk. The experience of dairymen has always been that good, plenteous pasture was a ration from which the best results were obtained at the pail. For the ordinary cow, say one that produces annually up to 250 or even 300 pounds of butterfat, good pasture supplies a complete and satisfactory ration. Of course there is a great difference in pastures. They range from the rather poor, rocky ones, that are found in some places in New England, to the rich, irrigated ones of the western states. On the former it may take from two to ten acres to the cow, and on the latter three and even four cows have been carried on each acre. It is very difficult to give any rule by which to judge pastures. As good a guide as any is to observe how long it takes an average cow to eat her fill before lying down to chew her cud. On a good pasture, a cow should be able to satisfy her appetite in about three or four hours of grazing night and morning. If she has to graze all day to satisfy her craving for food, it is a pretty good indication that she is not getting enough to eat. There are two things that indicate lack of feed readily; namely, the milk flow and the body weight. A decrease in either is significant and the careful feeder watches with the greatest care for any indication of lack of feed.

Pasture can be and often is supplemented with other feeds. This may be either roughage, which includes soiling crops, silage, fodder, straw, or hay, or grain or combination of them. Soiling crops as a supplement for pasture in the early spring and late fall are particularly useful since at those times pasture is frequently lacking in food material. The crop used depends upon the locality and the season of year in which it is to be used. Hay and silage are also used to supplement pasture especially in the late summer. The quantities of the various roughages needed depend largely on the cow and her appetite will serve as the best guide. If she is fed all she will eat up clean, she will usually be fed to her maximum capacity.

Grain Feeding on Pasture

When grain is fed as a supplement to pasture the amount and quantity will be gauged by the kind and extent of the pasture, and the size and breed of the cows. For average conditions a slight modification of the rule formulated by Dr. C. H. Eckles of the University of Minnesota is suggested as follows:

Jersey or Guernsey cows producing the quantities of milk indicated below, should receive for each 100 pounds of live weight:

20 pounds of milk daily.....	.35 pound grain
25 pounds of milk daily.....	.45 pound grain
30 pounds of milk daily.....	.6 pound grain
35 pounds of milk daily.....	.8 pound grain
40 pounds of milk daily.....	1.0 pound grain

For production above 40 pounds, one pound of grain should be furnished for each 4 pounds of milk produced. This rule is planned for cows that test approximately five per cent butterfat. Those producing milk that is much richer should be fed somewhat more liberally.

For Ayrshire, Brown Swiss, or Holstein cows for each 100 pounds of live weight:

25 pounds of milk daily.....	.3 pound grain
30 pounds of milk daily.....	.5 pound grain
35 pounds of milk daily.....	.7 pound grain
40 pounds of milk daily.....	.8 pound grain
45 pounds of milk daily.....	.9 pound grain
50 pounds of milk daily.....	1.0 pound grain

For production above 50 pounds, one pound of grain should be given for each 5 pounds of milk produced. When cows produce milk testing more than four per cent the quantities of grain should be slightly increased. When the milk tests below three per cent, the quantity of grain may be slightly decreased.

Soiling Crops

In localities where the land is very expensive and only fair pasture can be obtained, forage crops planted to mature for feeding in succession throughout the summer are frequently used. There is no question but that a greater quantity of feed can be raised per acre under such a system and this is an especial advantage for the dairyman with limited acreage. There is the added advantage that no feed is wasted by being tramped upon. In feeding such forage it is cut, removed from the field, and fed to the cows in a lot or in the barn. In general there are two disadvantages to soiling crops: (1) that considerable labor is required to cut, haul, and feed the forage, and (2) it is difficult to arrange a succession of crops that are ready at the right time during all seasons. Where used properly, the soiling system equals if not surpasses pasturing at its best. Primarily soiling is intensive and best suited to conditions where intensive cropping is desirable or necessary.

Summer Silo

More and more, in the dairy sections of this country, a small silo designed for summer feeding is taking its place with the essentials of a dairy farm. Designed at first to supplement pasture, in many instances it has entirely supplanted pasture. A silo of small diameter, so that at least four inches of silage may be fed daily to prevent undue spoilage, is the chief necessity. The summer silo has most of the advantages of the soiling system without its chief disadvantage, namely the necessity of using so much labor to get the material to the cows each day. The feed is stored in a convenient place and can be fed with the minimum of trouble.

ON THE DAIRY FARM OF G. A. WEED AND E. W. RUEHS, MICHIGAN

Winter or Stable Feeding

In most cases, summer feeding is comparatively simple and easy to handle for most farmers. Winter feeding, except in sections of the South or on the Pacific Coast where milk conditions prevail, is largely a problem of stable feeding.

The feeds which can be used may be divided roughly into three classes:—dry roughage such as the hays, straws, corn fodder, etc.; succulent roughage such as silage, moist pulps, and roots; and grains or concentrates. It is desirable that as large a part of the feed as possible should be grown on the farm. A common plan is to grow the roughage, both dry and succulent, and then as much as possible of the concentrated part of the ration, the grain. The problem of feeding therefore usually becomes one of figuring the most economical ration, using the roughages and grains available, and only purchasing needed concentrates such as bran, oil meal, etc., that are needed to effect the proper balance. This means that concentrated rather than bulky feeds will be purchased and thus the freight on bulky feeds saved.

Dry Roughage

Dry roughage includes all the hays, straws, and fodders that are fed to dairy cattle. Of the straws of the cereal grains little will be said because as a class they are not well adapted for dairy cattle feeding. By this is not meant that they have no feeding value, but that the nourishment which they contain is in a form which requires too much of the cow's energy in chewing and digesting the feed. For milk production, the cereal straws are also undesirable since they tend to dry off the animals. However, a straw stack to which the cows have access in addition to other

MILK CAMPAIGN WORK IN KANSAS

RENA FAUBION, KANSAS

JUST one year ago the milk campaign work began in Kansas. Since that time it has been conducted in various ways as city-wide campaigns, county-wide campaigns, and state-wide campaigns, all with equally good results.

A very definite and accurate health survey was conducted in Marion County, Kansas, by the county health officer and public health nurse. In this survey every school child in the county was weighed, measured, and physically examined. Then these weights and measures were compared with the standard chart of weights and measures prepared by the Department of Interior Bureau of Education, Washington, D. C., and it was discovered that out of the 3,704 children examined, 69% were 2% or more under standard weight according to their height and age, 34% or just about one-half of the number of children who were underweight were 8% or more below standard, 19% of the children were overweight and only 12% of the entire number examined were of standard weight.

With all of the evident proof of the past few years that milk is our best food and knowing that much of this underweight condition of children was due to undernourishment, the milk utilization specialist made plans for conducting milk demonstrations in rural and small town schools. This was the simple addition of a pint of milk a day at school for each child, otherwise their diet remained the same. Milk demonstrations were started in five schools in Marion County, four were rural schools and one a small town school.

In each school the children were weighed and measured at the beginning of the demonstration and at the end of each month during the demonstration. In the rural districts the children carried the milk from home in two one-half pint bottles; in the small town school the supply of milk was furnished by the school board. That the physical condition of the children could be greatly improved by good nourishing food was well proven in as short a time as ten weeks. In the primary room of the Lost Springs school there were sixteen children, two were 11 and 9% underweight, five were of standard weight, while the remaining nine were from 2 to 12% underweight. Five of these children were 10% or more underweight.

Children Gain in Weight

The entire number were given a pint of milk a day at school, taking one-half pint at the morning recess and the other half pint at the afternoon recess. The milk was served to the children in cups by the teacher who was assisted by the seventh and eighth grade children. This demonstration was continued through a period of ten weeks. The two children who were 11 and 9% underweight had reduced to 10 and 8% respectively and there was not a single child left in the 10% or more underweight class. Some of the children were still underweight but none of them more than 8% underweight. The average gain for these children was 1½ lbs., though some gained as much as 3 lbs. The normal gain for this length of time is one pound.

In another school where the demonstration was continued through a period of three and one-half months the following changes were noted: In the beginning 8 children were overweight varying from 3 to 42%, 2 children were of standard weight and fourteen children were underweight, three of which were 10% or more.

At the close of the demonstration 10 children were overweight with a somewhat increased percentage, eleven children were of standard weight and only two were underweight. One girl who was 17% underweight gained 11½ lbs. during this period of time and was one of those who attained standard weight. In addition to the physical improvement teachers reported an improvement in studies and conduct as well. They also said it had a tendency to do away with piecing between meals, so taking the results as a whole they were most satisfactory and milk was proven to be quite as good for Kansas children as for rats in the laboratories.

It was discovered early in the year that the reason many people did not use more milk in their diet was because they did not know of its food value or the importance in the diet. So educational campaigns of city, county, and state-wide scope were launched.

In these campaigns it has been our aim to secure local co-operation and to give out only true facts in regard to the food value of milk and its products. Some of the leading ways in which this material has been placed before the people have been newspaper publicity which consisted of paid advertisements and feature stories, window exhibits featuring milk as a food, its use and care; the use of milk posters displayed in prominent places, short talks made before school children, and organized meetings. Milk literature has been widely distributed and when given to children they were urged to carry it home to their mothers. Another effective way of teaching the milk lesson is through the "Milk Fairies" playlet. This is a very entertaining as well as instructive little play and children who see or have a part in it cannot help but know what milk can do for them. This play has been put on in several different communities in Kansas during the past year.

Increased Sales Follow

It is advisable to precede a milk campaign with a milk and health survey in order to know what local conditions are. From a survey in cer-

Human Side of Cow Testing

Horace Evans, Tester for the Plainfield Association, Tells His Former College Roommate How He Got Andy McRae "to Spend Some Siller" and Wm. Kent's Faith in Young Men

JULY 7.

DEAR Mike: Andrew McRae is undoubtedly the most picturesque member of the Plainfield Cow Testing Association. Andrew is all that the term "canny Scot" implies. He has not been too wise, however, not to profit by the work of the association, and there is a good lesson in his experience.

My acquaintance with Andrew began near the end of my first month's testing. After finishing my day's work for the preceding member on the route, I was taken on a long ride into the heart of a hilly backwoods district. At last, at a neat home situated on a knoll and entirely surrounded by a range of higher, tree-covered hills, I was met by this sturdy, middle-aged Scotchman.

With such a proprietor and in such a setting I half expected, before going to the barn, to find there a herd of the beautiful Ayrshires. In this I was not disappointed. Mr. McRae did have a remarkably uniform herd of these hardy, straight-backed cattle. Every animal was of the type and quality usually associated with large production. I was greatly surprised, however, to learn that their owner was profiting by these excellent purebreds practically no more than as if they had been only moderately good grades. This was because he did not realize their worth as breeding stock, and was not utilizing his opportunity to sell them for this purpose. Like his neighbors, he was selling milk to the condensery, this being about the only source of his dairy income. That he has finally come to see his opportunity and is now cashing in on both lines of his business I consider one of the best results of my year's work.

The trouble with Andy was that he and his herd were practically unknown beyond his immediate locality. Needing a bull for his herd of scrubs or grades, a neighbor would occasionally buy one of Andy, perhaps as often getting a scrub sire from another neighbor. In either case the price was always about the same, as McRae's neighbors did not know the value of a good sire, while he did not know that there was a better market for his stock. Once in a while a discerning breeder, happening to make his way into this remote district, would buy a few head of Andrew's cattle. These were also sold at bargain rates, just because he did not know their value and was taking no steps to attract buyers from a distance.

Andy was a very good feeder and an excellent breeder. He started many years ago with a few choice foundation animals, blood of which is found in nearly every member of his present herd. Being a master of the breeding art, he has been able to practice inbreeding with safety. Consequently he has found it necessary to introduce but little new blood into his herd, though when buying a bull it was always selected with great care. Fortunately he kept up the registration of his animals, but as his transfers to other breeders were few and he made no official records, the public heard nothing of him. He was a good example of the thrifty, satisfied Scot, deeply attached to his home and cattle, but not greatly interested in broadening the scope of his business.

While seeing the situation at once, I said nothing to Andy about it on my first trip. The next month, however, I began to try to get him interested in having some official records made, pointing out that they would help to increase the value of his animals. From the unofficial records which some of his cows were making in the cow testing association, I felt certain that they would have no difficulty in getting into the Advanced Registry and, as I could supervise the official testing in addition to my regular duties, the additional expense would be light.

I believed that Andy would also need some advertising, but refrained

(Continued on page 310)

Farmers' Week at Cornell

H. H. LYON, NEW YORK

CORNELL is again running normally this year, recovering from war effects. It is a great institution and its agricultural department is cramped for room. Plans are being perfected for additional buildings. Farmers' Week has been observed now for several years and with large numbers of farmer visitors. The most crowded lectures were those relating to farm management by Dr. Warren and those relating to milk problems and League activities, both from the dealer and the producer side.

The Price of Milk

Two consecutive addresses were given on the price of milk, the first one by F. A. Pearson. There are several methods of determining the price of milk. There was the old one where the dealers set the price at which they believed they might get a supply. There is the butter price and the cheese price, both of which are very similar. Then comes the surplus method and the cost of production plan. Finally, there follows the supply and demand and the index number idea. The first two, butter and cheese, are not very accurate because the conditions of production are different in these regions from that near the great cities and because milk is bulky and perishable and cannot be held. The surplus idea is difficult to control as sellers and buyers do not figure amount of surplus the same. Cost of production is fundamentally right, but other factors will cause sales at times below this and at others above.

Supply and demand are terms to be conjured with. Supply, within limits, will depend upon cost of production, but apparent demand depends upon various factors. The nearest one can come to it is the price level of all commodities. This last factor seems to be the index number. As a loose proposition supply and demand can be made to hide about as much truth as any two words are capable of doing.

Dr. Warren Speaks

Dr. Warren followed with a considerable number of charts. He commenced by considering the "size of a dollar". A changing dollar such as we have had for five years upsets all calculations. As prices have advanced, wages in general have not kept pace. In 1917 wages were too low, In a few lines they were too high, but others were entirely too low. Milk has not kept pace with the general level of prices except at short intervals, but it should stay up now as compared with other things.

One cause affecting the price of milk is that of production per cow which has more than doubled since 1855. It is now something over 5,000 pounds for New York State. Some say that no cow producing under 5,000 pounds should be kept, but if not there would be an enormous shortage of milk.

There is never any danger of an organization of farmers controlling prices unfairly, but the city man thinks there is. A city manufacturing concern can close down and compel an upward tendency of prices, but you can't put cows in cold storage to await higher prices. Low prices at the farm are more dangerous for the consumer than the producer. It is a good time now to get rid of the lowest producing cows in every dairy. There is no more sense in fixing the price of milk on the surplus than of fixing the price of beef on the worth of surplus for fertilizer. Get people interested in using more milk and use cost as a basis in determining the price.

Milk Distribution in New York

The secretary of the New York milk conference board gave some statements in relation to the distribution of milk. He seems to have revised his attitude as shown at the Watertown meeting somewhat. His topic, however, was a little different as he dealt with milk distribution mainly. He calls attention that the New York distributors serve almost one-tenth of the people of the country, namely, about 10,000,000 people, residing within a radius of about thirty miles. He asserts that in this area the milk has to be carried by trucks from the cars across the river, and for Brooklyn, across two rivers and much territory. In other cities of the country this is not true, many of them being able to place the cars right up to the milk stations. Housing systems in the New York territory are peculiar and make milk distribution costly. The racial and educational conditions and the diversity of habits and customs renders business difficult. Some have prejudices against certain classes of people and special men must be engaged to serve them. Union labor has made economical service difficult. Mr. Nathans contends that the sale of bottled and loose milk in stores causes higher cost to other distributors. The fact that Philadelphia and some other cities are able to send out wagons with 400 to 500 quarts while New York has only 220 to 280 per man, makes a difference. In the latter city as much milk is sold through the stores as by the delivery wagons of the dealers.

Mr. Nathans criticized the League for underselling the established dealers, calling it unfair practice. He also stated that the pooling plan would foster the production of poor milk and discourage good milk. When he got to these questions he seemed to forget his former fairness of statement; but these points were well answered by Mr. Miller of the League later in the day.

Condensery Representative Hits the League

H. M. Rowe, New York City, presented the Nestle's Food angle of the milk question. The dairy industry is sick, he said, and he is one of the physicians in consultation on the case. He contends that he is not opposed to co-operation when it is for the public good, but he contends that the present League co-operative plan is monopolistic and would be bad if it could succeed. This success he believes impossible and it is therefore a foolish scheme. It requires labor, capital, and business ability to make an enterprise successful, and he appeared to hold that the League lacks the qualifications of business ability. The condensers can buy milk and will be glad to do so pretty soon, as I understood his intimation, if it can be brought on a butter basis or a trifle above. We should come down to the Chicago price, which he figured at $1.935 for three per cent milk. His evident contention is that the present large concerns in the milk business are about the only ones that are worthy of success or can handle the business with efficiency. Anything which interferes with their activities he seems to think is an unnecessary hindrance.

Miller Replies for the League

The writer is a League member and a supporter of the pooling plan. Possibly for these reasons he sees more logic in the address by Mr. Miller than in those of Mr. Nathans and Mr. Rowe, so far as these gentlemen had to do with the League and with pooling. League territory, said Mr. Miller, is that which is engaged in

(Continued on page 335)

Canadian Dairy Notes

F. E. ELLIS, CANADA

PERUSING Hoard's Dairyman in recent months, has led me more than ever to the conclusion that there is a strong community of interest between the dairymen of Canada and the United States. Our problems of production are similar. The market problem is going through the same process of evolution on both sides of the border. Just at present the great problem facing milk producers is some method whereby we can exercise greater control over the sale of our products. Hitherto the city milk shippers have been fairly well organized and have been almost uniformly successful in getting their price. Aside from some interference from our Board of Commerce, all went well until the condenseries and powder milk factories ceased or partly ceased operations last fall. The executives of the milk shippers' associations were wise enough to see that they could not maintain the winter price agreed upon with so much milk being thrown back on the producers' hands. A general meeting was called of the Toronto producers who voluntarily made a reduction of the winter prices already agreed upon, but even at the lower levels it has been difficult to maintain the price and much milk is going into Toronto at less than contract figures.

Ontario Milk Prices

At present Toronto distributors are paying $2.90 per 80-pound can delivered, as compared with $3.25 in September and October. The present price is the equivalent of $3.30 a hundredweight at the farm. The few powder milk factories, that are again making powder, are paying $2.30 a hundredweight for 3.5% milk delivered at the plants, with 3 cents up or down for each point of fat. Condenseries are paying $2.25 for 3.5% milk. Creamery returns are about the same as condensery returns and cheese factories, when they open up, will probably pay somewhat less. Here we have a difference of about $1 a cwt. in the prices being received by the different classes of producers and the difficulty of maintaining such a difference is self-evident. Many producers in Ontario are coming to believe that the pooling system will supply the answer.

INGLESIDE PRETORIA VRANGUE

A Guernsey cow owned by Mountain Brothers, Iowa, which has completed a record of 10,894.4 pounds milk, 587.09 pound fat, in the double letter class of the Advanced Register. This record was begun when the cow was three years and seventy-two days of age and qualifies her for third place in class EE. The new class leader has been shown at several 1920 fairs in the middle western states and has won several first prizes as well as a number of grand championships. She was sired by Pretoria's King of Midlothian, a grandson of Imp. King of the May.

The Iowanola Guernsey herd, owned by Mountain Brothers, is one of the newer herds in the Central West. It has been developed from a practical foundation to a position in which it commands respect from all breeders.—AMERICAN GUERNSEY CATTLE CLUB.

Ontario producers have been watching the New York situation with the keenest interest and the successful launching of a pooling plan by the New York Dairymen's League will give a great impetus to the propaganda now being carried on for the introduction of a similar system in Ontario. We recognize that such a system would be much more difficult to inaugurate here as the greater part of the milk goes to the low priced markets—that is, to the cheese factories and creameries.

Mr. E. H. Stonehouse, the president of the Provincial Association, is confident that there are no difficulties that cannot be surmounted, and the "broadening out" policy, adopted at the recent meeting of the Ontario Milk and Cream Producers' Association, is the first step in that direction. Heretofore that association has limited its membership to city milk and cream producers. Hereafter it will include producers of milk, no matter what their market may be. The educational work of this and other dairy associations hereafter will be financed by a one per cent reduction from one monthly milk check, the amount being collected through the distributor or factory man. This will provide more ample funds to carry on a pooling propaganda. In the meantime it becomes increasingly evident that, short of monopolistic control of all milk produced, the city price cannot be based on cost of production but must be related to the selling price of other manufactured dairy products. The law of supply and demand makes this

necessary. The writer is one of those who is inclined to question if absolute monopoly is safe, even in the hands of honest, hard working dairy farmers.

Mr. J. A. Ruddick, Dominion Dairy Commissioner, has a suggestion for producers that may be adopted with little delay. He strongly advocates the establishment of co-operatively owned milk shipping plants, equipped to manufacture butter and cheese or ship milk and cream. His department has afforded an example of the advantage of such a station. Right in the heart of one of the cheese districts of Eastern Ontario is the Finch Dairy Station owned by the Dominion Department of Agriculture. This station makes cheese and butter or ships milk and cream as market wisdom dictates and last year was able to pay its patrons $2.67 per cwt. for their milk while cheese factory patrons in the same vicinity realized only $2.20.

Public Dairy Tests

Our winter fairs have come and gone and with them the usual three-day public dairy tests. These tests were designed at first to emphasize the importance of production records. In this connection they have now served their purpose. Testing is general and there is more real value to the breeder and less expense by submitting his cow to an official test at home, than by taking her to the public tests at Guelph, Ottawa, or Amherst. There is something about these public tests, however, that appeals to the sporting instinct. It is like racing horses to assemble a big barnful of the choicest cows of all the dairy breeds and then have them compete in milk and fat production for three days. The sporting instinct, which is as strong among dairy cattle breeders as among any other class, would seem to insure the retainment of a dairy test as a permanent feature of our winter fairs.

There were fewer entries in the dairy test at Guelph this year than for many years past. As compared with over 80 cows on test in 1918 and 1919, there were only 28 at Guelph this year. The sweepstakes cow was a 10-year-old Holstein from the herd of J. G. Currie & Son, with a three-day production of 267.4 pounds of milk, testing 3.28% fat, and a score of 292.9. This cow has three records of over 28.5 pounds of butter in seven days, and perhaps the most noteworthy point of the win was that she was exhibited by a young chap in his early twenties, who has taken cows to Guelph half a dozen times, has come right close to the top on several occasions, and had his persistence awarded with the sweepstakes this year.

The result of the dairy test at the Ottawa Winter Fair resulted in a great deal of discussion of a question on which our breeders are anything but agreed. Should government institutions compete with private breeders? Last year the Experimental Farm at Ottawa made several entries in the dairy test but, as they did not make any sensational wins, little was said about the innovation. This year the sweepstakes cow, Grace Fayne Aaggie, a six-year-old Holstein, was from the government herd. She has an official 31-pound butter record and in the three days of the public test, she made 233 pounds of milk testing 3.89% fat. The outstanding record of the test, however, was that of a two-year-old Holstein heifer entered by J. B. Dowler, Ontario, that gave the sweepstakes cow a close run with 200.7 pounds of milk testing 3.841% fat. She is a beautiful heifer and would look well in any show ring.

The Atlantic provinces—Nova Scotia, New Brunswick, and Prince Edward Island—held their winter fair at Amherst, Nova Scotia. This year 53 cows competed, representing five breeds. The sweepstake cow was again a Holstein, Queen Abbekerk Rooker, exhibited by R. L. Hicks, New Brunswick, with 203.8 pounds of milk yielding 8.81 pounds of butterfat. It will be noticed that none of these records, if continued for the seven days, would be anything more than creditable. Practically all of the cows that win in these public dairy tests make considerable higher official records at home. This verifies the statement made above—that the dairy test is a sporting event, rather than a real measure of producing ability.

More Vitamines in Green Pasture Milk

There seems to be more of a nutritional value in milk which is produced on green pastures than in that which is produced when dry feeds are given the cows. At the Wisconsin Experiment Station tests have been conducted in the feeding of milk to prevent scurvy. It has been found that summer pasture milk is very much more effective than dry feed milk in this use. The question arises as to whether green pasture milk is different in its constitution and whether it contains certain properties which cannot be had when cows do not have green feeds available. It is recognized that the cow's udder cannot form the vitamines so necessary to proper nutrition but that these substances come into milk from being concentrated in the feeds supplied the cow.

In the tests which have been made, it is shown that 50 parts of summer pasture milk were fully as effective as 75 parts of dry feed milk in preventing the disease scurvy. It was indicated, however, that the milk produced by cows on dry rations was not altogether lacking in the qualities necessary in the treatment of this disease. Silage from corn which was well matured and partly dry before it was put into the silo did not improve the dry fed milk in this point, nor did the feeding of mangels make it more effective. Both silage and mangel milk was like the dry feed milk and unlike the summer pasture milk in its power to prevent scurvy.

"BALL BAND" TRADE Red Ball MARK

Look for the Red Ball

The one sure way to get strong, well-fitting, long-wearing Rubber Footwear is to look for the Red Ball Trade Mark when you buy.

This round Red Ball is on the knee of every "Ball-Band" Boot, on the heel or arch of every Arctic and Light-Weight Rubber.

More than ten million people look for the Red Ball—they know what it stands for. Sixty thousand stores sell "Ball-Band" Rubber Footwear.

Ask your dealer for our free illustrated booklet, "More Days Wear."

Human Side of Cow Testing

(Continued From page 307)

from saying anything about that until he had started the official testing. Too many suggestions at once probably would have resulted in his doing nothing. Moreover, he needed the official records to back up any statements that he might make in print. But when he had gotten a half dozen yearly records nicely under way, I ventured to open the subject with him.

"You really ought to do some advertising, Mr. McRae," I said. "You have a fine bunch of young stuff here that would bring you good prices, if other breeders only knew that you had them. You see, you might have the best cows in the state, but if nobody knew it you would still have to sell them at the prices of grades, or for beef."

"Hoot, man," he replied quickly, "I dinna advertise. It costs."

"Sure it costs," I hastily agreed. "But the prices you will get for your cattle will more than justify all the extra expense. You seem well satisfied with your investment in the cow testing association as a milk producer. As a breeder of good Ayrshires you can well afford to invest in advertising in order to profit on them as breeding stock."

Always a man of few words, Andy made no promises as to what he would do in regard to advertising, but I could see that he was thinking about the matter. On my next stop at his place I had the pleasure of helping him in arranging a small advertisement of his cattle, which he had decided to place in a farm paper for several months. "It's an experiment tae see if the koo tester kens what he talks aboot," said Andrew with a twinkle in his eye, though I knew very well that this frugal Scotchman wasn't in the habit of spending his money for anything unless convinced that it was wise to do so.

The "experiment", however, is turning out well. Since the little advertisement began to appear, a number of breeders have visited Andrew, and their comments on the quality of his cattle have opened his eyes considerably. He has also made some excellent sales, especially for a breeder so little known. Breeders have taken some of his surplus stock, though his best trade is from beginners with purebreds and farmers looking for registered herd headers.

After being accustomed to sell his neighbors registered animals at grade prices, the prices which he has been getting lately have surprised him a good deal, but finding out what other raisers of pure-breds are doing has helped him to survive the shock. I have just made the final test for his first yearly record, the cow making a fine showing. A breeder, who happened to be at the farm when I added up the record, wanted to buy her on the spot. Andy refused to sell this cow, whereupon the visitor took two of her relatives and said that we could look for him again when more of the yearly records were complete.

"You're a' right, son," Andrew said after the breeder had left. "You made Andy spend some siller tae do it, but you showed him how to sell the Ayrshire kye."

Nothing that I have done at Plainfield gives me more pleasure than the help I have been able to give Andrew McRae. He was a good herdsman a year ago. Now he is a business man as well. The good dairyman has to be both, Mike. Don't forget that. As ever, HORACE.

the Plainfield Cow Testing Association. It was from him, you may remember, that Stanley Miller, the former green city kid who is now making good, learned the dairy business. I, too, owe Mr. Kent a large debt of gratitude for the information that I have absorbed from him during the last fourteen months. When I started here he very kindly arranged my route so that I would spend the last few days of each month at his place. In this way I had an opportunity to see the intimate side of his life, as well as to study his dairy methods quite thoroughly.

I shall not say much about Bill's farming methods. Probably if I tried to describe them in full you would say that I was having another day dream and painting a beautiful picture of farm life. That, however, is just what Bill is doing—painting a beautiful picture of farm life. This is not to say that Bill's farm is cluttered with the knick knacks that millionaire farmers usually strew about their agricultural playthings. His is a 320-acre demonstration of modern, practical methods of dairying, the beauty being in the fact that he is doing every day the very things which his less progressive neighbors are saying "can't be done". If you care to know anything more about his methods, just apply those which the dairy "profs" handed out to you during your four years in college to a half-section of land and note the result. That will be Bill Kent's farm.

Kent, the man, interests me far more than his dairy practices. Considerably past middle age, he is of the kind of men that absorb a good deal of philosophy of life as they go along. He has lived a busy, rich, and successful life, but instead of retiring he has chosen to remain on the farm in his own community where his counsel and help are most useful. He is especially fond of seeing young fellows like you and me get the right start in life, and in helping deserving ones to do so. Several such young men in the association owe their farming start to Kent, and there are at least a dozen more farmers in this county who obtained their first pure-bred cattle from him. His Holsteins are the leading herd of the breed in Winton County, and good enough that the men who have obtained foundation stock of him may well consider themselves fortunate. Several very good herds have grown from the beginnings which Bill Kent helped to establish, and in their success he takes almost as much pride and interest as do the owners themselves.

It is not in Bill Kent's heart to take advantage of a beginning breeder just because his customer is new at the game, either. He always has seen to it that the beginner has gotten the best foundation animals that Bill could spare, and often he has let a heifer go that he would rather have kept in order to give some young chap a good start.

"I like to see the beginner with pure-breds start with as good cattle as he can possibly afford," he once said to me. "He is laying the foundation probably for a lifetime of breeding experience, and much of his future success will depend upon how well he builds at first. Nobody knows how far he will be able to go, nor how much credit he may bring to the man who sold him his first cattle. For this reason every breeder can afford to be particularly careful when selling a man his first pure-breds.

"Besides, it is good business. If the new breeder gets good animals and is satisfied, he and maybe his neighbors are likely to come back for more of my cattle. But if he is disappointed and goes about lamenting his purchases he becomes a wet blanket on the whole pure-bred business, and especially my share in it."

I like to hear a man who has been "through the mill" talk that way. It gives a young fellow a good deal of encouragement. It rather looks, too, as if William Kent is going to have an opportunity to help in starting one more youngster on the right path. You see, Mike, it's this way. When Stanley Miller married Bill's daughter, Marjorie, he didn't get his only daughter. Marilyn was left, and she has just decided to become Mrs. Evans.

For a while I thought that perhaps a course in matrimony, with Marilyn as rudder and a few of Mr. Kent's cows as an anchor, might take the place of that year in college that stands between me and my sheepskin; but Marilyn decided all that by insisting that she, too, was going back to finish school before any wedding bells rang for her. So, in a few more days I'll be back to the University for the rest of my course. After that Marilyn and I will also be ready to start out with some of the Kent Holsteins. As ever, HORACE EVANS.

[EDITOR'S NOTE:—These two letters conclude the series prepared by Frank M. Chase.]

Accredited Herds in North Carolina

The State College dairy herd of North Carolina has been placed on the accredited tuberculosis free list as having successfully passed tests for two years. There are now in North Carolina 176 accredited herds. There are in the state also 986 other herds which have been given one test.

Do You Want More Profit from Your Herd?

You can get more milk out of every cow you own—if—you'll put her in shape to give more.

Modern dairymen acknowledge that health and cleanliness—comfort always and water when she wants it—are the things that add extra quarts to milk production from any cow.

This is an old story to dairymen using Star Equipment, but it means more profit to the man whose barn is not as good as his herd.

1 Star Alignment Device
Instantly lines cow at gutter after she is in stall—keeps stall, bedding and cow clean.

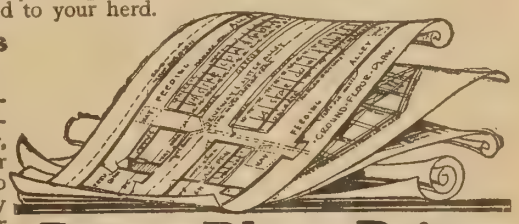
2 Star Stanchion Adjustment
Narrows or widens stanchions to exactly fit cow's neck. Safety and comfort.

3—Star Curb Clamp
"Sets a stall in 60 seconds"—permits of concrete work being finished before stalls are set. Cuts time of installation in half.

4—Star Unit System Stall
Each stall assembled before shipment, ready to go in place the moment it arrives.

5—Star Wood Lining
Hard maple lining forced in U bar, anchored so it won't come out.

"STAR EQUIP" Your Barn



Easy to Install

When your barn is "Star Equipped" you can say so with pride, for money won't buy and factories can't build better stalls, stanchions, Litter and Feed Carriers than those that carry the STAR trademark.

Exclusive features, work savers and money makers, protected by U. S. patents, put Star Equipment in a class by itself. For instance, the STAR Unit System Stall enables you to put in as few or as many stalls as you need and add more as you add to your herd.

Star Equipment Makes Your Barn Modern

The Star Line is not confined to Steel Stalls, Stanchions, Water Bowls, Pens, Ventilating Systems, Litter and Feed Carriers, but also embodies Harvester Hay Tools, Cannon Ball Door Hangers, Hoghouse Equipment, Garage Door Fixtures, and all kinds of farm specialties. It takes a 320-page catalog to tell the Star story.

Send for Big Catalog of Star Barn Equipment

Your name will bring the finest catalog ever issued—a 320-page bound book worth owning for the useful information it contains. The only expense to you is the trouble it takes to write.

Barn Blue Prints Worth $10.00 FREE!

Made Especially for Your Needs

Just specify on the coupon below the number of cows, young stock and horses you want to house and the experts in our Plan Department will send you a practical set of blue prints (elevation, floor plan and outside) of a barn especially suited to your requirements. And it doesn't cost you a cent. This is our "get acquainted" offer. Mail this coupon. We'll mail the plans free.

Coming Events

Farmers' Grain Dealers' Association meets at Sedalia, Mo., March 16 and 17. Secretary, John Sheay, Columbia, Mo.

May 23—Missouri State Holstein Association ——— Annual Show of Sale Cattle at Sedalia, Mo.

Wisconsin Butter Chief

Mr. John E. Boettcher has been appointed by Wisconsin's Dairy and Food Commissioner, J. Q. Emery, from the position of creamery and dairy and food inspector, to the position of "Chief of the Butter Division". This vacancy was made by the voluntary resignation last June of Mr. H. C. Larson, to assume the duties of State Secretary of the Wisconsin Buttermakers' Association.

Mr. Boettcher began his career while yet a boy by helping in the gathering of cream. At the age of sixteen he was a buttermaker in his father's creamery and for 20 consecutive years thereafter followed the occupation of buttermaker. In the meantime, he became the owner and operator of several creamery plants in Wisconsin. He graduated from a course in dairying in the College of Agriculture of the University of Wisconsin in the class of 1909. He has been with the Dairy and Food Commission for the past nine years.

Paid to Feed a Balanced Ration

HOARD'S DAIRYMAN:—Speaking before a meeting of Fulton County, Indiana, farmers recently, Hurley Rogers gave the folks some figures showing not only that it pays to feed a balanced ration to the dairy cows but that it also pays well to keep close to the recommendations of the dairy departments of the agricultural colleges.

"In common with many other dairymen," said Rogers, "I thought that cottonseed meal was too high priced to feed. My neighbors had told me that with corn and oats as low priced as they are this year, that corn and oats was plenty good enough and that it did not pay to purchase concentrate feeds. Many of the men who said this had been dairying much longer than I had and so I believed them. However, I did not get the results from my cows that I thought I should be getting although they were given the prescribed amounts of feed in proportion to the milk flow.

"Finally a neighbor of mine wrote to the dairy department of Purdue University, giving them the feeds already on his farm and asking them to recommend a balanced ration using the feeds already on hand and recommending such purchased feed as they thought economical. The authorities suggested that he give the cows silage and all the corn fodder they would clean up. In addition there was recommended a mixture of 400 lbs. of ground corn, 200 lbs. of ground oats, 200 lbs. of cottonseed meal, and 200 lbs. of linseed meal.

"I got a copy of this letter and thought I would try out the suggestions for myself for a few days on my 18 cows. I guessed off the 100 lbs. each of corn and oats, trying to get about equal parts but probably getting a little more corn than oats. I mixed in 100 lbs. of cottonseed meal and 100 lbs. of oil meal. The other 100 lbs. of cottonseed meal was fed extra to cows that had freshened in the fall or early winter. This 500 lbs. of mixture lasted six days and that was long enough to show me that it paid and paid well. Here are the results:

"For the first six days in February, I fed the old ration of silage, fodder, corn, and oats. The cows averaged 205 pounds of milk per day. The next six days, I fed the recommended ration and the average milk production was 290 pounds per day or an average gain of 85 pounds of milk. In the six days, the increased milk brought me $13.27. Now what did it cost me? I paid $2.35 a sack for the cottonseed meal and $2.50 for the oil meal so the two sacks of cottonseed meal and the one sack of oil meal cost me $7.20. Expressed in few words, I simply traded the cows $7.20 worth of concentrates and got back $13.27 worth of milk, or a gain over my old ration of $6.07; better than a dollar a day net profit as I did not feed the cows any more corn and oats than with the other ration. But that isn't all; after the second six days in February I kept right on with the balanced ration and I am not only getting increased milk flow but my cows are picking up, they act better, they look better, and they produce much better. The man who isn't cutting the corners in production by feeding his cows a balanced ration is losing some income that is easily within his reach."

Indiana. I. J. MATHEWS.

ATTRACTIVE CONCRETE BARNLOT AND YARD FENCE IN INDIANA

An Oregon "Pool Pound"

This is a term used by the Oregon Dairymen's League to express the factor which results when the weight of milk is multiplied by the test plus six-tenths. "Pool pounds" is a coined term. It occurs only in connection with the plus six-tenths method of making payment for milk. To each member's test is added six-tenths and this sum is multiplied by the weight to arrive at the number of pool pounds. The value of a pool pound is determined when the pool is closed, by placing the net sum received for all the milk in that pool and dividing it by the total number of pool pounds of all the members in that pool. The value of a pool pound is not the same each month.

Why do we use the plus six-tenths method? Because it is the most equitable basis of determining the value of milk of different tests. The test alone gives the amount of butterfat in milk but does not reveal the other solids which have a value that must be recognized. Tests can be made for other solids in milk but such tests are slow and expensive. They are not practical.

Other solids, usually called solids not fat, vary in about the same proportion as butterfat, but not in the same ratio. Milk that is rich in butterfat is also rich in casein, albumen, milk sugar, and lime, but these other solids do not increase in the same ratio as butterfat.

Actual trials over a period of years in the cheese sections of the United States have demonstrated that when six-tenths is added to the test of all milk it takes care of the inequalities of the solids not fat as compared with the fat and is just to milk from low testing herds, medium testing herds, or high testing herds.

League milk is tested the same as it always has been and six-tenths is added to the test before multiplying by the weight.

Statements accompanying the final check on the closing of any pool will hereafter show the weight, the test plus six-tenths the number of pool pounds, and the value of a pool pound for that month. Weight times test plus .6 times value of pool pound equals the gross sum due on the statement.

The plus six-tenths method is not used in calculating cream statements for the reason that butterfat is the only factor of value represented in the sale of cream, and the Babcock test shows the butterfat accurately.—Oregon League Dairyman.

Dodder Destroys Alfalfa

Dodder is a parasitic plant, infesting clover and alfalfa chiefly. It is a bad weed in Europe, though conditions in the United States are not as favorable as in Europe for damage by dodder; hence the appearance of the pest on the farm should not occasion undue alarm. Nevertheless, dodder may cause a great deal of damage, and it should not be allowed to grow unmolested.

Dodder is usually introduced on the farm by impure seed. Other means are infested hay; moving objects, such as animals and wagons; irrigation water carrying seeds and pieces of stem; and viable dodder seeds contained in stable manure.

Dodder seed, with the exception of that of large-seeded dodder, may be cleaned from impure clover and alfalfa seed by screening. It is practically impossible to remove large-seeded dodder by screening. The seeds of field fodder are also difficult to remove entirely from clover and alfalfa seed.

During the first season of infestation in clover or alfalfa, dodder usually occurs in small scattered areas. Such infested areas should be either mowed and removed before the dodder matures seed or else burned in the field. If seed has formed, burning is the only remedy, since it kills not only the plants but also the seeds of dodder which may be lying on the soil surface.

If the infestation is so great that patch treatment is impracticable, the crop may be either plowed under or utilized for hay and the aftermath closely grazed to prevent seed from forming. Sheep are especially useful in grazing dodder. If dodder seed has formed and the crop has been very seriously damaged, the safest method is to cut the crop, allow it to dry, and burn it in the field.

Dodder does not attack cereals; consequently oats, wheat, etc., should be incorporated in the rotation following the infestation of the soil with dodder seeds. A tilled crop, such as corn, will cleanse the soil of most of the dodder seeds. In place of clover or alfalfa, other legumes, such as soy beans, velvet beans, and cowpeas, may be grown, since dodder never damages any of these crops. The seeds of dodder in the soil may remain viable for a period of five years or longer.

A number of cultivated crops besides clover and alfalfa are subject to dodder infestation; the most important of these are sugar beets, onions, and flax.—Farmers' Bulletin 1161.

9,000 Signers Needed for League Pooling

H. H. LYON, NEW YORK

THE March milk price for New York has been announced at $2.10 a hundred for three per cent milk as a base price at 200 miles. This is not much over twenty per cent advance on the pre-war level, although feeds remain some seventy per cent higher, wages fully a hundred per cent, and the general price level according to authorities considerably more than a hundred. It looks as though all of our dairymen will sell again beginning in March. It has been a lonesome time for some fifteen to twenty thousand League members who have had to shift in all sorts of ways to dispose of milk.

One encouraging feature is that such concerns as the Nestles are to buy quite largely. The cut in price as I see it might have been avoided if we could have commenced to pool on the first of the month. There would have been a few cents reduction but no such cut as we have. Now we wonder what about April, for we no sooner get by one mark than we look for the next. There may be nine thousand signatures yet to secure before we are ready to commence business. It does not seem to me that we can be ready by April first. If not, I see no way but to stand another cut. It hurts to do this too, for it is hard after we go down a peg to get back where we should be. If the dealers would take hold and help put this deal over it would do more to bring friendship than anything else.

Those farmers who are hindering the pool are making losses for themselves as well as for the rest. We are going to pool and to delay now means only loss and nothing gained. When we get the fifty thousand there may not be a big demand for further signatures. Of what use can the others be to us? Perhaps we ought in duty to take care of those who have hindered all they can. Perhaps they ought to pay up a little for the fun they have had if they get in later. Isn't that justice? They have been invited and urged, even begged to sign. It is even now the eleventh hour. At that they have a chance. There is a story of a big boat that was ridiculed and its builder also. By and by there was a shower and then those who ridiculed wanted shelter. The eleventh hour had gone and they couldn't get in.

There are 90,000 members in the League. That is the book number, with seventy thousand or so active in dairying. It is astonishing how many in four or more years have gone out of business. There is a large number who produce milk for the interior cities and the villages in the state. When these have been eliminated from the pooling, there are about sixty thousand left that are affected by the pool. This is the best estimate that I have. After we get the fifty thousand and there are only ten thousand or a little more left and these are so badly scattered they cannot make us any considerable trouble by holding out.

When you come to analyze this we see that quite a number of those affected are poor men and somewhat ignorant. Many, I know, are well-to-do and are delaying to see how it works and then without taking a share in the risk and trouble they will coolly take the benefits. We have already had such experiences. Curiously enough the men who are holding back and refusing to sign are largely those who are intelligent enough to see the light.

In relation to the purchase of milk on the first of March there is at this moment one disconcerting feature. It is reported that that element among the dealers which has done its best to defeat the League for five months is unaware that it is beaten. Some if not all of those dealers are said to be prepared to disregard the League and will offer to buy direct of farmers at about League prices. Just how far this action extends does not appear today. One big concern has ordered local men to post $2.40 for four per cent milk where the League makes $2.05 for three per cent. This is five cents under the League price for both make four cents a point for fat test. It is the small boy who is determined to have his own way by making slight evasions as far as he dare. These concerns are not supposed to deal with the League at all.

It is somewhat of a question what local farmers will do under the circumstances. Shall they sell temporarily in this way until the pooling can be brought across or refuse as they have done for five months at a somewhat lower price? In certain cases they are attempting to start creameries of their own and if these have gone along far enough it might be thought best to continue with them even if lower prices came to them. There are places where farmers will stand back and demand buying of the League or not at all, no matter at what price. It is possible that some will decide to take the price temporarily if not necessary to bind themselves to remain any length of time. It may take several days to determine what farmers will do as a rule.

Farmers Urged to Treat Seed This Spring

In these days of labor that is hard to get and keep, high priced land and seed that is expensive, it is of the utmost importance to treat the seed and insure the crop against loss from smut.

Seed treatment is cheap. The cost should not exceed two cents a bushel for chemical. The treatment is not a cure-all for the many ills to which oats are subject. It, of course, cannot take the place of a high yielding variety, it cannot substitute for a thorough cleaning in a good fanning mill, and it will not insure a good crop on poor soil. Furthermore, treated grain takes up more space in the seeder and for this reason about three-fourths bushel more to the acre should be sown than where dry, untreated grain is used. Damp, treated grain should be kept away from frost or the ability to germinate will be destroyed.

Methods of Treatment

1. The use of a smut treating machine has been very successful among Wisconsin farmers. In the most popular machine the formaldehyde solution, one pint to about 35 gallons of water, is put in the pan at the bottom, the grain is dumped into a hopper that has a sloping bottom which ends in the solution pan. On the under side of the hopper is a worm elevator which takes the grain through the solution and out into a sack. The treated grain in the sacks should be covered with a blanket for a couple of hours after treatment; then the sacks should be untied and set up singly around the barn floor or wagon. If gunny sacks are used there is no need to empty the grain to dry it out. When tight woven grain sacks are used it may be necessary to empty the grain onto a barn floor or canvas to dry it out. Two men can handle about fifty bushels an hour with one of these machines, and have the grain all sacked ready to sow the next day.

2. The dipping or soaking method is probably the most efficient method that can be used. In this the solution is made up at the rate of one pint or pound of formaldehyde in about 35 gallons of water in a barrel or tank. The container should be half filled with solution; then take the grain in loosely filled gunny sacks and soak in the solution for five minutes. Drain on boards over the barrel and pile the grain on a clean floor or canvas where it can be covered with a blanket or canvas for two hours. This covering is important as it allows the formaldehyde to kill the spores. When the two hours is passed remove the cover, spread the grain out a few inches deep and shovel or rake it over occasionally so it will dry.

3. The sprinkling method of applying formaldehyde has been widely used, but there is usually some smut spores that are not killed in this treatment. Make up the solution the same as in the other methods. Put it in an ordinary garden sprinkling can and apply as the grain is being shoveled over from one pile to another. Use about a gallon to a bushel. After sprinkling, cover with a canvas or blankets and handle as in the dipping method.

RICHARD E. VAUGHN.
Wisconsin College of Agriculture.

The Attorney General's Ruling and Its Relation to Quality

HOARD'S DAIRYMAN:—Under an editorial in Hoard's Dairyman of Feb. 25th, entitled "Neutralizer and Adulterated Butter", the editor gets off on the wrong foot and temporizes with a question that must be met fair and square. During the past decade we have seen the butter substitutes forge to the front and take a market that should have been the dairyman's. Today in many country towns you can not buy butter. One of the reasons for this condition, and not the least, is the lack of quality in butter offered to the public.

Quality butter can only be made from good cream; but with hundreds of trade-marks, for as many different factories, the public had nothing as a guide in buying, and were just as liable to get poor as good; and consequently they turned to a well advertised and standardized product, oleo.

If it were impossible to make and deliver good cream, then would the attorney general's ruling be detrimental, but there is not a patron of a co-operative creamery anywhere who can not produce and keep his cream in such a condition that it will not need neutralizing; but if there is no incentive to produce good cream, a majority of dairymen will not endeavor to do so, and this works an injustice to those who try to make a high grade product. There are a number of creameries in the United States grading cream and rejecting all low grade stuff. Does it pay? Watch the quotations and you will find a spread of from 7-15 cents between 88 and 92 score butter.

Allowing poor cream to compete with good amounts to an unfair practice, and we today are suffering more from the competition of inefficient and careless dairymen than we are from Danish butter. The packing plants were forced to clean up. Why should butter manufacturers and cream producers not do the same?

Neutralized butter means butter made from cream not produced and kept under good sanitary conditions, and the ruling of the attorney general will do more to hasten the clean-up and force those who will not clean up out of business, than any action that has ever been taken. When the time comes that a united dairymen's association can put out a common trademark for a definite grade of goods, then we will have no need of a protective tariff.

Michigan. RAY BAKER.

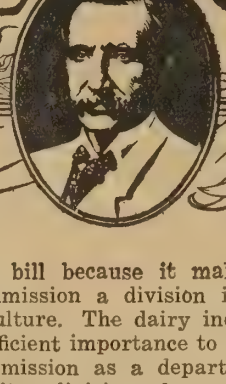
New York Milk at $2.10

The New York Dairymen's League Board of Directors has voted to recommend to the members that League milk for March be sold at $2.10 per hundred in the 200—210 milk zone, with the usual differentials for freight and butterfat. The League price for February was $2.58 per hundred pounds, but at this price that portion of the milk which had been sold previous to October first to manufacturers was not sold. It is said that the price of $2.10 for March will move a large part of this milk.

This price has not been definitely accepted by the dealers, but the League has been definitely assured by several of the large manufacturing companies that they will open many of their plants on March first at the $2.10 price. The number of plants opened will depend on the ability of the companies to get the necessary help and organization together again after months of inactivity, and many of those plants which they are not able to open on the first of the month will be opened some time during the month.

Thousands of dollars have been spent by the milk companies upon propaganda calculated to destroy the confidence of members in their organization and to get the milk business back where the dealers could deal directly with individual dairymen. The determined refusal of the dairymen to sacrifice a principle even in the face of heavy continued loss for months, now seems likely to be rewarded by the sale of most of the milk in League territory for March through their organization, the Dairymen's League.

While the price of $2.10 is below the cost of production, yet it is better than farmers are receiving for most other kinds of farm products. Dairymen feel that with over 40,000 co-operative contracts signed, making the pooling of proceeds an assured fact within a very few weeks and with the organization again about to sell nearly all of the milk of its members for March, the milk situation on the whole looks more hopeful than it has in several months.—Dairymen's League News.



Near East Relief

HOARD'S DAIRYMAN:—The appointment of Milo D. Campbell, president of the National Milk Producers' Federation, to serve with Senator Capper on the Agricultural Committee for the Lenten Sacrifice appeal made by the Near East Relief in behalf of the Armenians, is one that should call the special attention of all dairymen in the country to this very worthy cause. The committee asks the men and women and children of America to make some sacrifice, at this Lenten season, consecrated to the memory of Christ's great sacrifice, for the men and women and children of Armenia who are hungry and naked and homeless, entirely dependent on American charity for their very existence.

Five dollars feeds an Armenian for a month and ten gives him both food and shelter. Contributions should be sent to state headquarters or to the national headquarters at 1 Madison Avenue, New York City.

New York. MARY L. WILSON.

EDITORIAL COMMENT

THE Chicago price for market milk testing 3.5%, for the month of March, is $2.35 per hundred. This price pays no premium for market milk. Butter scoring 92 or better is quoted on March first in Chicago at 54 to 56 cents a pound. If the prices of butter for the month of March are maintained at their present level, good creameries will pay at least 60 cents a pound for fat to their patrons. This will bring a return of $2.10 per hundred pounds of 3.5% milk and the patron will have 85 lbs. of skimmilk left for feeding young stock. The present price of hogs makes 85 lbs. of skimmilk worth 40 cents.

Those farmers enjoying a market of a good creamery or cheesery need not envy the producer who ships milk.

THE herd of Thomas J. Owens of Washington furnishes some valuable figures showing the strong influence of a Guernsey bull in increasing the production in a grade herd through his daughters. Mr. Owens brought together a herd of grade cows at prices ranging from $50 to $75. He states that these were considered by their sellers to be the culls from their herds. They have been kept under good conditions and fed well and as mature cows show an average production for a year of 9,072.6 lbs. of milk containing 354 lbs. of butterfat. They have been bred to a high class pure-bred Guernsey bull. The heifers resulting, at the average age of two years and seven months, made a production, the same year in which records on the dams were kept, of 7,361.2 lbs. of milk containing 306 lbs. of butterfat. This is an excellent showing for two-year-old heifers and indicates a very good increase over the productive capacity of their dams, due to the influence of a pure-bred sire. Allowing a minimum increase of twenty-five per cent for mature records over the production of these heifers as two-year-olds, their mature butterfat average should be at least 382 lbs. of fat, which, calculated on this minimum increase, is 28 lbs. more than their dams have made.

FARM LOAN ACT VALID

The United States Supreme Court has decided that the farm loan act is valid and that the exemption from taxation of the bonds of the federal farm loan banks and joint stock land banks is legal. Farm mortgage corporations desired a decision which would hold the farm loan act unconstitutional unless the bonds were taxed. Those who favored the farm loan act held to the opinion that the act was valid and that the final decision of the supreme court would be favorable.

The case has been pending for many months and this has been an inconvenience to many farmers who had planned to secure funds through the farm loan act. It is well for the farmer that the Supreme Court made a favorable decision regarding this law, for it provides a system of farm credit which is highly desirable. Applications from farmers for loans total $75,000,000, showing there is a large demand for funds for financing agriculture.

A POOR BILL

A bill has been introduced in the Wisconsin Assembly by Mr. Freehoff which assumes to correlate the Bureau of Markets, the Department of Agriculture, the Dairy and Food Commission, and the State Board of Health.

No arguments or evidence have been presented that would indicate a greater efficiency or less expense to the tax payers if Mr. Freehoff's proposed rearrangement of departments were carried into effect. We are opposed to his bill because the duties of the Dairy and Food Commission, the Department of Agriculture, the Bureau of Markets, and the Health Department are not mutual, and therefore cannot be correlated. We are opposed to Mr. Freehoff's bill because it makes the Dairy and Food Commission a division in the Department of Agriculture. The dairy industry of Wisconsin is of sufficient importance to keep the Dairy and Food Commission as a department by itself and not make it a division of some other department. Its importance to the people of the state entitles it to be responsible to the governor only as the appointing power and to the people as sovereign.

If the Freehoff bill were to become a law it would scatter the forces of dairy and food inspection. It would mean also a duplication of inspection which would be more expensive, less efficient, and wholly unnecessary. For example, a food inspector can discharge all the duties of inspection in a grocery store, from determining the proper labeling of foods to the sanitary condition of the store. A creamery or cheese factory inspector can inspect every phase of these institutions and there would be no reason for sending an inspector, for instance, from the Health Department to see that the buildings are in a sanitary condition. It is sheer nonsense for anyone to lay plans for duplication of inspection. The Dairy and Food Commission has a chemical laboratory and is in efficient hands. The passing of Mr. Freehoff's bill would mean that the Health Department would of necessity have to establish a chemical laboratory. Here again is a duplication of expense.

There may be some necessity for amending the laws of the Dairy and Food Commission, of the Health Department, or of the Marketing Commission, but Mr. Freehoff's bill accomplishes nothing except to increase expenses, to lessen the efficiency of the Dairy and Food Commissioner, to provide for duplication of work and to give opportunity for a laxity in the enforcement of our dairy and food laws. It destroys the Dairy and Food Commission.

THE NEUTRALIZED BUTTER RULING

Elsewhere in this issue we publish a short discussion of neutralized cream and quality butter, prepared by Mr. Ray Baker of Michigan. The purpose of the editorial to which Mr. Baker refers was to set forth what constitutes adulterated butter and to point out the erroneous interpretation of the adulterated butter law by Attorney General Palmer.

The adulterated butter law has to do with butterfat and butter and has nothing to do with the processing of milk and cream. Foreign material or too much water added to butter makes it adulterated. It is our contention that the attorney general had no power under the adulterated butter law to rule that butter made from neutralized cream—no matter what its condition might be—was adulterated butter.

We object to any official usurping power which is not extended to him by law. Congress is our law making body and if we are to have an orderly, stable, and sound government, the officials who have the enforcement of law in charge must abide by the law just as much as the persons for whom the law was enacted. It is not a question of whether neutralization is right or wrong. The question is, has the attorney general rightly interpreted the adulterated butter law when he holds that butter made from neutralized cream is adulterated butter? We can get no such meaning out of the law and the only way any one can make such interpretation of it is to hold that milk and cream, as Commissioner Williams has done, mean the same as butterfat and butter. This is absurd.

Mr. Baker says there is no incentive to produce good cream. This seems to be true in certain sections and in other sections it scarcely applies, as Mr. Baker points out that the spread in price between 88 and 92 scoring butter varies from 7 to 15c per pound. Every thinking man who is interested in the advancement of the dairy industry appreciates the injustice of not grading cream and not paying for it according to grade. Mr. Baker is in error when he says that neutralized butter means butter made from cream not produced and kept under good sanitary conditions. Cream may be sour and yet clean and wholesome.

If it were true that sour cream is unclean, then a law should be passed to prevent such cream from becoming a food product.

WHO SUFFERED MOST?

We have pointed out on several occasions that the dairy farmer has not suffered as large a decline in the price of his commodities as has the farmer engaged in the production of other farm products. The Iowa farmer finds his corn worth about 41c a bushel and, in order to get that, it must be shelled and marketed at considerable expense. Corn last June was selling in Iowa as high as $1.75 a bushel.

The cotton farmer, according to Mr. Howard, President of the American Farm Bureau Federation, has suffered more than the corn farmer and the wool producer more than any other farmer. It is in times like these that the dairy cow shows her stability and how she can be depended upon to carry her owner without severe losses.

Here and there in the dairy industry dairy farmers have met with rather severe losses, especially where condenseries have been closing, but dairying, as a whole, has not felt the decline in prices as much as have other branches of farming. The prices of feeds have declined more than the prices of dairy products, making it possible for the dairy farmer, in many cases, to receive a larger profit from his cows this winter than he did last.

The prices of the various farm products point out that the farmer who depends so largely upon any single crop, such as corn, cotton, and wheat, suffers larger declines in such periods as the present than the farmer who devotes his energies to the growing of several crops, and especially the farmer who keeps a good herd of dairy cows. It may be said that while corn is selling on the farm for 41c a bushel in Iowa, in Wisconsin—where the crop is very largely turned into milk—it sold in the market in January for 84c a bushel.

WHY NEUTRALIZE CREAM?

Much cream is produced in territories where there is not a sufficient quantity to permit the operation of a local creamery or to pay to gather the cream every day. Much of this cream is kept several days or until it is sour. In manufacturing this cream into butter, it has been found that neutralization permits the pasteurization of such cream without excessive loss of butterfat, improves the quality of butter, and makes it a more wholesome food product. This does not mean that butter should be made from unsanitary cream or that such butter should not be properly labeled.

Neutralization is a harmless process so far as the resulting butter is concerned and sour cream may be a clean and wholesome product. While this is all true, the whole story is not told.

Neutralization is a makeshift process in the manufacture of butter. Conditions which require cream to be neutralized are far from being ideal and they cannot be approved as being contributory to the production of a high quality of butter. Such conditions may be termed the drag of the dairy industry—the holding back of the dairy industry. Neutralization encourages the production of poor cream, and, insofar as it contributes to the production of poor grades of cream, it cannot be favored. To be sure, there was poor cream before neutralizer was used. Nevertheless, the neutralization process gives excuse for the continuance of poor methods of handling cream and these lead to the production of much cream that neutralization will not improve, cream that should not be made into butter.

Concerted effort should be made to do away with the necessity for neutralization. Local creameries

can provide methods for gathering cream frequently enough so it comes to the creamery in sweet condition and the patrons can be taught methods that will produce a high quality of cream. Many local creameries grade cream and refuse to take that which needs to be neutralized. The patron, however, who will not produce good cream, finds it easy to deliver or to ship to some centralizer or local creamery using neutralizers. Centralizers or creameries which accept such cream work injury not only to the creamery that grades its cream, but to the quality of butter and therefore to the entire dairy industry. Too many excuses are being offered for poor cream and too much of it is being produced. The losses incurred to the dairy industry through poor cream by depreciation of prices of butter and by lessened consumption are too great to be compensated by excuses or neutralization.

Permanent Pastures

I am planning on seeding down a field that I expect to use as a permanent pasture. What kind of a grass mixture would you recommend for this soil and climate? The soil is a heavy clay, and has been cropped several seasons to grain, peas, and lastly to corn, which was almost a complete failure.

Clear Lake, Wis. L. P. S.

In planning on laying down land into permanent pasture, there are several fundamental principles which must be observed if one expects to meet with success. First of all, the soil should be brought into proper condition to receive the grass seed mixture. If the field to which our reader refers has been fall plowed, it will be well to give it a good dressing of stable manure which can be worked into the soil during the preparation of the seed bed. This will insure a reasonable degree of fertility and consequently a better stand of the grasses. In this connection, we might add that it would be well to test the soil for an acid condition and, if found to be very sour, an application of from two to four tons of ground limestone per acre should be applied. If the soil needs lime, now is the best time to apply it, because after the sod is formed, a surface application to the grass will not be as effective, although it might be practiced. In establishing a permanent pasture, one should have in mind the productiveness of the pasture, and only a proper soil condition can make a pasture productive.

The grass mixture which will be used should consist of those grasses which will give the most immediate returns. Undoubtedly the best grasses to use for permanent pasture mixtures in this section of the country on such soils as described are blue grass, redtop, and white clover. But since it takes a relatively long time for these to become established as a turf, it is well to seed them in a mixture of more rapidly growing grasses and clovers in order to secure the greatest returns. We would suggest something like this: Timothy, 4 to 6 lbs.; red clover, 4 to 6 lbs.; alsike clover, 3 to 5 lbs.; blue grass, 10 lbs.; red top, 5 lbs.; white clover, 2 to 4 lbs. This amount to be used as an acre rate of seeding. The seeds should be thoroughly mixed and seeded in the spring with a spring sown grain as a nurse crop. Too much emphasis cannot be laid upon a thorough seed bed preparation. The mixture may be seeded with the grain drill grass seeder attachment, but care should be taken not to bury the seed too deep. A half an inch is sufficient. The seed might also be broadcasted by hand or with a grass seeder, and then the field harrowed lightly to cover the seed.

The year following the seeding, a hay crop, consisting of clover and timothy, may be taken from the field providing everything goes well. From that time on, the field may be pastured as heavily as conditions warrant. The clovers, excepting the white clover and the timothy, will disappear, and ultimately the timothy will go, leaving a pasture consisting quite largely of blue grass, red top, and white clover.

Maryland Ration

Please balance a ration from the following feeds: Corn and cob meal, ground oats, bran, a 16% protein dairy feed, linseed meal, cottonseed meal, and salt. Will soaking in molasses water add to its feeding value?

How much cream can be obtained from 100 lbs. of 4% milk, and how much butter can be obtained from the cream?

How much curd can be obtained from 100 lbs. of whole milk, from 100 lbs. of skimmilk, from 100 lbs. of buttermilk?

Ellicott City, Md. C. E. F.

If our correspondent can furnish his cows as much of legume hay as they will consume and supply silage at about the rate of 30 pounds per 1,000 pounds of live weight, he will secure good results from supplying in addition a concentrate mixture of 300 pounds of corn and cob meal, 200 pounds of bran or ground oats, 200 to 300 pounds of the commercial dairy feed, and 100 pounds of oil meal or cottonseed meal. He should feed this mixture to high testing cows at the rate of one pound for each three or three and one-half pounds of milk produced and to low testing cows at the rate of one pound for each three and one-half or four pounds of milk produced. He will benefit through using molasses in making coarse roughages more palatable, by sprinkling them with a dilution of molasses. Also molasses may be fed by mixing it with the concentrate mixture.

A choice should be made between oil meal and cottonseed meal on the basis of their local market values. Feed salt separately rather than including it in the grain mixture. Allow the cows as much or little of it as they will consume, using it in the form of bricks or placing it in boxes in the yard or other place where is it readily accessible. When fed on silage or grain, about one ounce of salt per cow is usually allowed.

One hundred pounds of four per cent milk contains four pounds of butterfat. Calculated on the 80 per cent basis, this butterfat is the equivalent of five pounds of butter. Curd varies so much in its moisture content that no exact figures can be given concerning it. Perhaps calculations can be made from the fact that whole milk averages to contain 13.6% dry matter, skimmilk 9.9% and buttermilk 9.4%.

Seeding Timothy on Alfalfa

May I express my appreciation of the article by John B. Abbott in your January 14th issue, entitled "Silage Corn a Good Nurse Crop for Alfalfa". It is something I have had in mind for some time and now I mean to try it out.

Some little time ago you spoke of sowing timothy with alfalfa. I wish I might be informed how much timothy to sow in a last year's alfalfa field in which the stand of alfalfa was not as thick or as good as it should be. Is it good practice to sow brome grass in a blue grass pasture in which the blue grass seed sown last year is slow in starting? Can I sow sweet clover on rather moist land and expect it to do well?

Allentown, Pa. C. S. B.

Owing to the fact that we do not know the thickness of the alfalfa stand to which our reader refers, we are unable to say just how much timothy seed he should use. However, we would judge that from 5 lbs. to 8 lbs. of seed should be used per acre. It is quite possible that after the timothy seed has been scattered, it would be beneficial to disk the field lightly in order to bury the seeds somewhat. This can be done without materially injuring the alfalfa plants.

Blue grass is naturally slow to establish itself. The thinness of stand may be due to an insufficient amount of seed used per acre or to a poor quality of seed. We would advise the use of additional blue grass seed, together with some red top, timothy, and white clover. This we would consider superior to an addition of brome grass.

Sweet clover has a wide range of soil adaptability. Although it prefers a well drained soil containing an abundance of lime, it will endure wet or poorly drained soils better than either alfalfa or red clover. It probably will do quite well on the soil to which our inquirer refers.

Treating Oats for Smut

Last year our oats had quite a little smut. What is the best method for dipping in formaldehyde? Is formaldehyde a good preventive for smut? We don't have much sun for drying around seeding time.

Hollywood, Wash. H. C. S.

It is advisable to run seed through a good fanning mill before any treatment is given. This will remove not only the blighted kernels and light seed but also take out the spore balls, many of the free smut spores, and considerable dirt and other foreign matter. The formaldehyde method will control oat smut satisfactorily.

In making the solution, use one pint of strong commercial formaldehyde (40 per cent) to 35 gallons of water in a barrel or tank. Dip about a bushel of the seed in loosely filled burlap or gunny sacks into the solution and soak for 5 minutes. Raise the bag from the solution and allow the surplus water to drain back into the tank. After draining, empty the oats on a clean floor or canvas and cover with wet sacks or canvas for two hours. This covering is important as it prevents too rapid evaporation of the formalin.

It is difficult to dry oats if a much longer treatment is applied than suggested. After the two hours are up, spread the oats out on a clean floor, stirring them occasionally with a rake or shovel. They will dry faster if the wind can blow over the wet grain, but it is not necessary or desirable to do this work out-of-doors, one of the best places being in the driveway of the barn if it is available for this kind of work.

The seed should preferably be sown as soon as it will run freely, or, if dried thoroughly, it may be stored in clean bags or bins until it is planted. Care should be exercised that freezing does not take place as it will either lower or destroy the germination. When seeding is done while the grain is still damp and swollen, the seeder or drill should be set to sow about three-fourths of a bushel more to the acre than the usual amount.

Barrels or tanks are not injured by the use of formalin and may be latter used for other purposes when properly rinsed and aired out.

A New Mexico Ration

I would appreciate your compounding a balanced ration for a cow from chopped alfalfa; wheat bran, $2.75 per cwt.; wheat shorts, $2.55; corn chop, $2.00; cottonseed meal, $2.75; ground oats, $2.35; and milk retailing at 15c per qt. or 60c per gallon. I can also get corn stover and sorghum cane.

At present I am feeding all the chopped alfalfa hay my cows will clean up for roughage, and equal parts ground oats, corn chop, wheat bran, and cottonseed for concentrate. One pound for each three pounds of milk, with an ounce of stock salt per cow per day, mixed in the grain.

Belen, N. Mex. W. D. C.

Alfalfa gives a good basis for a first class dairy ration. This excellent feed gives an advantage over feeders of dairy cows, in many sections, where this feed is not available. It should be fed in as large amounts as will be consumed. Corn stover and sorghum cane, if of good quality, may be fed in as large amounts as will be cleaned up; not to replace alfalfa but to add variety and as supplements.

A mixture which will be somewhat more satisfactory than the one which is being used may be made from 300 pounds of corn chop, 200 pounds of ground oats, and 100 pounds of cottonseed meal. This may be supplied at the rate of one pound for each three pounds of milk, if a cow is a high tester, or one pound for each four pounds of milk produced if a cow is a low tester.

Bran at $55 per ton is altogether too high priced. Oats at $47 is considerably cheaper. Neither would we recommend shorts at $51, the combination of cottonseed meal, corn chop, and oats being cheaper.

Our inquirer will do well to allow his cows to consume as much or as little salt as they choose, rather than including it in the grain mixture.

Sunflowers for Silage

Please tell me how and when you plant sunflowers, when you cut them for silage, and how far apart you put the seeds. Can they be put in with a grain drill?

Elmhurst, Ill. C. F.

Sunflowers for silage are planted in the same manner that corn is planted. The variety most generally recommended is the Mammoth or Giant Russian, although in North Dakota there is the recommendation that the Black Beauty and White Beauty are quite satisfactory.

The amount of seed required per acre will vary according to the closeness of the rows and the nearness of the plants in the rows. When used alone, it will take from 6 to 8 lbs. of seed per acre but when seeded with corn from 3 to 5 lbs. will be sufficient. The seed may be planted with the corn planter or with the regular drill with the spout stopped so as to seed in rows 36 to 42 inches apart. Where the ground is reasonably free of weeds, it will be found preferable to plant the sunflowers as closely together as when planting corn for silage. Under this system of planting, the stalks will not be inclined to grow so large or become quite so woody.

If sunflowers are to be harvested at the same time the corn is harvested, we would generally prefer to plant them two weeks later than corn. If it is expected to ensile them alone, without reference to the corn, then they may be planted at the usual time for corn. A discussion as to the time for cutting sunflowers for silage appeared in our issue of February 18th.

Neutralizer Hearing in Washington

[SPECIAL TO HOARD'S DAIRYMAN]

THE hearing given on February 25 and 26 by W. M. Williams, Commissioner of Internal Revenue, on the protest of butter manufacturers against the treasury ruling that certain use of neutralizer in the process of butter manufacture makes the products "adulterated butter", subject to the adulteratel butter law, attracted a big gathering of representatives of dairy production and dairy manufacturing interests. At times there were upward of one hundred persons in attendance.

The larger number were present to protest against the ruling. There was a smaller number of advocates of the ruling and a few representatives of the oleomargarine industry. Three-quarters of the time was taken by opponents of the ruling.

This controversy was precipitated by an announcement from the Treasury Department in January quoting verbatim a letter which had been written to Attorney General A. Mitchell Palmer by Secretary of the Treasury Houston relative to the use of neutralizer in the process of buttermaking, and the reply from the Attorney General in which he stated that the use of neutralizer "with cream which was decomposed or rancid" or with "cream high in acidity and of bad odor" resulted in butter which was adulterated under the Butter Act of 1902. The announcement, which was a "press release" for the use of newspapers and newspaper correspondents, added this comment at the end of this verbatim quotation of the letter of Attorney General Palmer, "This means that all butter made from cream which has been neutralized is adulterated within the meaning of the Act", and explained that this meant that not only must a tax of ten cents a pound be paid on such butter, but also that manufacturers and dealers in such butter must pay the license fees provided by the Act. At about this time the Commissioner of Internal Revenue also issued a formal treasury opinion, quoting the language of the attorney general's letter exactly, and instructing deputy collectors to impose licenses and collect the tax, as indicated by this opinion.

It now appears that there is a wide difference between the treasury ruling and the "press release" which came to the attention of the butter trade generally. This was brought out in a number of instances at the hearing, and Commissioner Williams specifically repudiated the "press release" saying it may have originated in his department, but that all he was standing on was the formal treasury ruling; that he, unless the ruling was withdrawn or modified as the result of hearing, proposed to tax butter made from "cream which was rancid or decomposed" or from "cream high in acidity and of a bad odor", provided a neutralizer was used in the process of making such cream into butter, and did not propose to tax "all butter" made from cream to which a neutralizer had been added.

This position, although greatly different from that understood from the original "press release" purporting to tell what the ruling meant, did not satisfy the butter manufacturers who came to protest. They protested that the law gave the Commissioner of Internal Revenue no jurisdiction over the use of a neutralizer in cream, that the law did not cover the specific cases mentioned, that cream which was rancid or decomposed is not made into butter, is subject to the prohibition of federal and state pure food laws, and its manufacture could not be permitted even under the tax and licensing provisions of the revenue laws, and, finally and most important, that the neutralizer process is not an adulteration and does not permit the use of cream not fit for food in the manufacture of butter.

The Commissioner opened the hearing by asking for a list of those present who wished to be heard. The protestants were represented by Attorney F. L. Jones of Washington, Judge Hainer of Omaha, and Judge White of Chicago. Minnesota dairy interests supporting the ruling were represented by Christ Heen, State Dairy and Food Commissioner; Julius Hortvet, state chemist; and James Sorenson, secretary of the Minnesota Creamery Operators' and Managers' Association. Dr. H. W. Wiley appeared for himself in support of the ruling. The milk producers of the country were represented by Milo D. Campbell and George W. Warber, president and secretary respectively of the National Federation of Milk Producers. Two interests attempted to get a hearing but were refused: Professor E. O. Fippin, representing the American Lime Association, and Dr. J. S. Abbott, representing the Institute of Independent Margarine Manufacturers.

THE UNLOADING PLATFORM AT WATERLOO CREAMERY CO., MINNESOTA

The Abbott incident was unusual. The "press release" announcing the hearing had stated that representatives of the manufacturers of pure butter, of adulterated butter, and of oleomargarine were invited to the hearing. Dr. Abbott stated that he represented the manufacturers of oleomargarine and came in response to the press announcement. Commissioner Williams stated that he had no knowledge of the press announcement and could not see where the oleomargarine people had any interest in this hearing which affected butter only. The oleomargarine representatives were interested listeners throughout the proceeding.

In opening the case, Attorney Jones raised the question of jurisdiction of the Internal Revenue Commissioner. He called attention to the wording of the law which provides that the addition of any "acid, alkali, chemical, or any substance whatever", to "parcels of melted or unmelted butter or butterfat"—the quotations being the exact language of the law—does not refer to or mean the addition of these substances to cream. He further attacked the correctness of the legal interpretation on the ground that the statute specifies the purpose or effect which must accompany the addition of the foreign substance in order to constitute an adulteration, as "deodorizing, or removing therefrom rancidity," and stated that the experts he would swear would prove that the purpose and effect of the neutralizer was not to "deodorize or remove rancidity" but to partially neutralize acid to put the cream in condition for effective and economic pasteurization, and that in fact to neutralize did not deodorize or remove rancidity. He further stated that the neutralizer process alone made possible the continuation of the great creamery and dairy interests of the prairie and western states, and that the economic effect of this ruling would be disastrous to this great industry.

On the legal aspects of the case, Attorney Jones introduced excerpts from the debates in Congress when the act was passed, showing that an amendment was proposed substituting a section specifically mentioning "cream" instead of "parcels melted and unmelted butter or butterfat", and that this was defeated. He also placed L. B. Kilbourne of Chicago on the witness stand who testified that he was a joint author of the section in question, when the bill was prepared and passed, and that he understood and had always believed that the wording was introduced for the sole purpose of controlling the handling and manipulation of "packing stock" or, what was common practice then, the buying of "parcels of butter or butterfat" which were sometimes rechurned, sometimes melted, or otherwise manipulated into "ladled" or into renovated butter. As to the fact and practice of the neutralizer process and its effects, Mr. Jones called H. J. Credicott, Professors Hunziker, Bouska, A. C. Anderson, and Frandsen. They all testified that neutralizer does not deodorize, does not overcome rancidity, and does not cover up defects in cream which make it objectionable or unfit for use.

The bulk of the witnesses and the statements presented for the record were on the economic effect of the ruling. On this point the Commissioner asked every witness if he based his opinion of the economic effect on the treasury decision or on the statement in the press release which he said he was not standing on. Every witness of this group protested that the interpretation as in the press release was absolutely ruinous to the industry. Most of the witnesses protested with equal vigor against the treasury decision, holding that the terms "high in acidity and of a bad odor" were so indefinite and subject to such variety of judgment and opinion that the mere enactment of such a ruling would subject the creamery industry to such an uncertainty that was equally destructive.

One of the most effective statements made was that of E. P. Rector of the Fairmount Creamery Co. He stated that his company operated with the neutralizer process, and that out of 27 million pounds of butter made last year, from cream collected in 17 states, 25 million pounds had graded and sold as No. 1 butter.

Before beginning the hearing of attorneys and witnesses, Commissioner Williams heard statements by a number of senators and representatives whose constituents had asked them to appear, all without exception asking for a modification or withdrawal of the ruling.

Coming, finally, late Saturday afternoon to the friends of the ruling, Commissioner Williams heard first a general statement by Christ Heen, State Dairy and Food Commissioner of Minnesota. He stressed in particular the fact that Minnesota by state law made the use of neutralizers unlawful, and stated that he would show by sworn evidence that the process was harmful, that it permitted cream to be used which should not be used, that it added foreign substances to the butter, that it harmed the dairy industry, and that the ruling was justified and should be enforced.

His first witness was James Sorenson, who presented a long and vigorous arraignment of the neutralizer process. Mr. Sorenson made some new points in his discussion, one that the use of neutralizer led the farmers to a lack of care of their cream because of the fact that if it were rejected by the local plant, it could be sent away to the centralizer plant, and that in his experience he had never known of a can of cream thus rejected at the local plant to be rejected at the neutralizer process plant. He also testified that the lime used as a neutralizer does pass into the butter. This was later corroborated by State Chemist Hortvet. He denied that lime is not a deodorizing agent, and swore that it does deodorize, and further that it makes it possible to pasteurize cream so that odors were driven off and that neutralization and pasteurization should be considered together in determining "purpose and effect". He declared that the worst result of the process was the effect on cream producers leading them to neglect to properly care for their cream so that cream and butter are constantly growing poorer instead of better. State Chemist Hortvet was the final witness for the Minnesota people and corroborated the statements of Mr. Sorenson and added expert testimony as to the effect of lime which he claimed did in fact deodorize and adulterate the butter made from poor cream.

Both Sorenson and Hortvet were subjected to cross examination, the former being signalled out for a grilling by Attorney Jones, but the Minnesota man proved to be both experienced and thoroughly posted on his subject and more than a match for the cross examiner. Dr. Wiley was not present on Saturday afternoon, and his expected statement was therefore not heard.

From the bulk of the testimony and documentary evidence, it is probable that it will take the best part of a week to get the transcript ready for the Commissioner and that therefore his decision as to a withdrawal, modification, or affirmation of the treas-

ury ruling will be considerably delayed. This will also be complicated by the question as to whether or not the new Republican secretary of the treasury will retain Commissioner Williams at the head of the Internal Revenue office. There will also be a new attorney general by the time this is printed. However, since this is the first time the entire "neutralizer controversy" has had a full presentation before any officer clothed with possible or probable authority to decide as to its merits and legality in whole or part, the case has been a most interesting and important one. Dairy interests need to be on guard in many ways as to the outcome and results of the whole controversy.

February Condensery Prices

[Report by U. S. Bureau of Markets.]

During the month of January prices of sweetened condensed whole milk in the United States showed very little change except in certain sections, the average price increasing from $9.39 per case to $9.41. Unsweetened evaporated whole milk, however, showed marked increase in price in several sections and very little change in others, with an average increase for the month of 9 cents per case.

Stocks in the hands of manufacturers on February 1 showed material reductions, particularly on case goods of both condensed and evaporated milk. Stocks of bulk condensed on February 1 showed reductions of approximately 40 per cent except at New York City where there was very little change.

Compared with last year there was a general increase in stocks of condensed milk ranging from 25% to over 900% while evaporated milk stocks of all classes showed 10 to 12 per cent reduction under those of last year with the exception of bulk of which the quantity is very limited and which showed an increase of 7 per cent. This condition of stocks indicates a rather healthy and improving condition in the evaporated milk market, which is further improved by an increase of exports of nearly 100 per cent over the exports of the previous month and of the corresponding month of last year.

Due to this general improved condition in the evaporated milk market, quite a number of factories making evaporated milk were reopened during the month of February.

Price paid to producers for milk for condensing purposes showed a reduction for the month of February as indicated in the accompanying table of prices in all sections except New England where prices were slightly higher.

With the general improvement in financial and industrial conditions throughout the country and an increasing demand for condensed and evaporated milk, especially evaporated, it would appear that the crisis which has existed in the condensed and evaporated industry during the past months, is rapidly clearing up and that conditions in general throughout the industry are much more favorable from the standpoint of milk producers and manufacturers of condensed and evaporated milk than they have been for the past six months or more.

Prices Paid Producers

Prices paid producers for 3.5% milk delivered at factories during February, as reported below, are based on reports made by condensed and evaporated milk firms operating approximately 50% of the total number of factories in the United States:

Geographic sections	Case and bulk goods: No. of factories	Case and bulk goods: Price per cwt.	Bulk goods: No. of factories	Bulk goods: Price per cwt.
New England	1	$2.41	3	$3.52
Middle Atlantic	16	2.63	23	2.57
South Atlantic	1	2.40	5	2.06
East No. Central	64	1.98	27	2.43
West No. Central	1	2.00		
South Central				
North Western	14	1.81	5	2.40
South Western	11	2.09		
United States	108	2.07	63	2.50

Manufacturers' Wholesale Selling Prices

The wholesale prices given below are based on reports made by manufacturers covering actual sales, during January, of condensed and evaporated milk delivered to jobbers, wholesale grocers, and similar buyers on basis of cash or short time credit. Foreign prices are given as f. o. b. or f. a. s. points of export in section in which sales were made:

Geographic sections	Sweetened condensed* Domestic	Sweetened condensed* Foreign	Unsweetened evaporated† Domestic	Unsweetened evaporated† Foreign	Sweetened condensed‡ Unskimmed	Sweetened condensed‡ Skimmed	Unsweetened evaporated‡ Unskimmed	Unsweetened evaporated‡ Skimmed
New England	$9.25	$10.25	$5.64	$5.75	$12.54	$6.55	$10.45	$5.14
Middle Atlantic	8.64	8.58	5.59	5.30	13.63	6.57	12.42	5.56
South Atlantic	9.43	8.88	5.71	5.75	12.72	6.93		3.63
East North Central	9.42	10.25	5.40	5.21	11.98	6.73	3.49	6.08
West North Central	9.70	10.25	5.60	5.75	12.54	7.55	9.06	10.56

*Case contains 48 14-ounce cans. †Case contains 48 16-ounce cans. ‡Bulk, per cwt.

Butter Prices for February

The butter market in February raised from 46c to 51c in Chicago, and from 49c to 53c in New York. Boston showed an increase of 3c and Philadelphia, 5½c.

From the daily quotations of the U. S. Bureau of Markets we have compiled the following table giving the monthly averages of the daily wholesale prices for February, 1920 and 1921, on 92-score butter (extras) in the four principal markets, together with the receipts of butter at these markets:

	Average price Feb. 1921	Average price Feb. 1920	Receipts Feb. 1921	Receipts Feb. 1920
	Cents	Cents	Tubs	Tubs
Chicago	46.75	62.50	132,106	125,945
New York	47.23	66.61	147,033	149,346
Boston	47.52	65.48	50,024	42,348
Philadelphia	47.80	67.36	37,565	46,937
Total receipts			366,728	364,576

Ninety-score butter averaged 43.87 cents for February on the Chicago market, with centralized butter at this market selling for 46.14 cents, or nearly as much as extras sold for.

Jobbers' prices on extras sold to retailers during February averaged 48 cents in Chicago and 50.23 cents in New York.

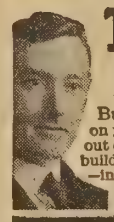
The executive committee of the Michigan State Farm Bureau Federation has appointed Mr. Clark L. Brody as secretary of that organization. He comes to this work with a successful record in organization work. He has had an unusual experience and success in rural development and has organized twenty-three marketing associations and four rural markets which take care of a large portion of the fruit, milk, eggs, and cream produced by the farmers in St. Clair County. We are informed that Michigan has 90,000 farm bureau members.

When You Are Late You Pay the Penalty

When you miss a train or an important appointment, you know how your schedule for one whole day simply goes all to smash.

Keep to your schedules by a watch whose accuracy is proved by the thousands of railroad men who prefer it. Hamilton Watches are the timekeepers most popular with American railroad men.

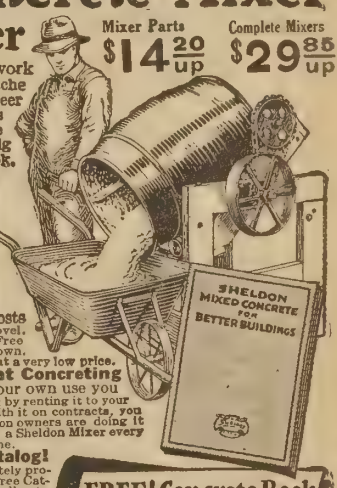
Hamilton Watch
"The Watch of Railroad Accuracy"



Conductor Dan Mandaville, shown above, has been in Erie service 45 years. His run is between Jersey City and Binghamton—out on No. 5, back on No. 6. He has been carrying for 14 years that Hamilton he holds in his hand.

A Hamilton costs no more than other watches and gives you accurate time in all going, rough or smooth.

Prices range from $40 to $200. Movements alone, $22 (in Canada, $25) and up. Send for "The Timekeeper," an interesting booklet about the manufacture and care of fine watches. The different Hamiltons are illustrated, and prices given.



HAMILTON WATCH CO., *Lancaster, Pa.*

The Farmer's Concrete Mixer
SHELDON Batch Mixer

Mixer Parts $14.20 up
Complete Mixers $29.85 up

Build for permanence. Put a SHELDON Mixer to work on your farm. Saves time, labor, money. Takes the backache out of concrete. Gives you a better job. Sheldon is the pioneer builder of mixers for farmers. Thousands in use now on farms —in every state. Buy a Sheldon. Build your own concrete tanks, feeding floors, silos, foundations, etc., at a big saving. Costs only $16.80 and upward. Write for book.

Read What These Sheldon Owners Say

It is the greatest labor saver I have on my farm. Two men can do ten times the amount of work in one day and do it ten times easier than the old way.—HARRY L. WALLACE, Jeromeville, O.

The machine I bought of you in 1916 has given continual service to date *without a single repair*, and at present needs only the small cast wheels that support the drum, and their supports.—ASA A. GOBLE, Huntington, Ind.

Owing to the scarcity of labor the machine is practically indispensable in making farm improvements with concrete.—J. McGRARY, Massena, N. Y.

I am more than busy with my Sheldon Mixer. I have more work than I can do. I get $10 a day when I work out.—JESSE L. WITTER, Wellsville, N. Y.

Last spring we purchased a set of castings to make a concrete mixer. It was constructed per the plans furnished and *it surely worked great.*—D. M. BRUBAKER, Freeport, Ill.

George Hank of Ackley, Ia., writes that he "put through" 106 yards of concrete in 21 hours. That's more than 40 cubic yards for an eight-hour day.

FREE PLANS

Make your own concrete mixer. Costs so little you can't afford to mix by shovel. With our iron and steel parts we send Free Plans and a permit for building your own. Or, we will sell you a built-up machine, at a very low price.

You Can Make Big Money at Concreting

If you buy a Sheldon Mixer for your own use you can make many times its cost in a season by renting it to your neighbors. Or, if you want to go out with it on contracts, you can easily earn $10 to $20 a day. Sheldon owners are doing it right now. The jobs go to the man with a Sheldon Mixer every time. A profitable side line for spare time.

30 Days Trial! Write for Catalog!

Our special 30-Day Trial Privilege absolutely protects you. Write for details. Get our Free Catalog showing full line of mixers sold direct from factory on strong guarantee. No other like it. Two styles, hand and power. Mixes 8 cubic feet a minute. One man can operate it, but it will keep 2 to 6 men busy. Continuous chain drive. Tilting discharge. Easily and quickly moved. All parts guaranteed. Does work equal to $400 mixers. Get the catalog and full information. Write today.

SHELDON MFG. CO.

FREE! Concrete Book

Get our new 176-page Book on Concreting. A real text book written by an expert! Gets right down to A. B. C.'s. Contains detailed instructions, tables plans, and cross sections—132 illustrations. Invaluable to any man in planning construction. Free, postpaid, when you buy a Sheldon. To others, $1.

THE AUTO-OILED AERMOTOR
A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

A year's supply of oil is sent with every Aermotor

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Aermotor Towers are Towers of Strength

A tractor *pays* for

TEXACO TRACTOL

just as surely as a team pays for good feed

YOU know, from long experience, how much more work you can get from your horses when you give them better feed.

Do you realize how much more work you can get out of your tractor by using the kind of lubricating oil that suits it best?

Texaco Tractol is made for just one use—tractor engines and bearings. It is the result of years of laboratory investigation and countless tests to find just the right oil that is needed for an engine that runs at full power for long periods of time.

Do not confuse Texaco Tractol and Texaco Motor Oil. If they were the same we would not make both. Texaco Motor Oil is intended for use in automobiles and motor trucks. Texaco Tractol meets the far different conditions of tractor operation.

Texaco Tractol is an oil that has great lasting qualities—it is an oil that maintains a complete lubricating film under heat that would break up a light oil—it is an oil that discourages carbon by keeping the cylinder walls *clean*.

Texaco Tractol is sold in 33 and 55 gallon steel drums, in wooden barrels and half-barrels, and 5-gallon sealed cans. Your dealer can tell you what grade your tractor needs.

TEXACO Motor Oil

The uniform oil that keeps your motor active. It is a fine, lasting oil that completely retains its lubricating properties despite engine heat. It so perfectly seals the clearance between piston and cylinder, that no gasoline can leak into the crank case. Thus full compression is secured, and every last ounce of power used that the gas has to give. Be certain to get the can with the red Star and green T.

HUDSON (Formerly) Strickler

Make a Quick, Clean Job of Every Load

A Hudson Carrier in your barn this season will make quick, easy work of putting away your hay. These Carriers are simple, extra strong, positive in action and easy dumping. Used with either slings or forks they pick the load up clean, lift it quickly and easily. We make carriers for steel, cable or wood tracks, adaptable for use with any style of fork or sling.

Catalog Free

Get ready for haying now. The Hudson Catalog will be sent free and postpaid for the asking. Shows the labor saving way best suited to your barns. You will be surprised how little it costs to put in the Hudson equipment you need now. Insist on the Hudson dead-lock Carrier. Write for the free Catalog today and we will give you the name of our dealer near you or see that you are supplied. (11)

Simple Ways of Feeding Dairy Cows

(Continued from page 306)

roughage frequently is very useful. If straw is fed, it should be chopped fine and preferably moistened with feeding molasses diluted with hot water. Pea straw, clover straw, cowpea straw, etc., are all used to some extent. Clover straw and several of the legume straws are fair feeds if they have been kept in good condition and are not too dry. At best, however, they are but a poor substitute for hay.

Dry corn fodder or, more exactly, corn stover, since the ears are usually removed, is a common roughage for cows throughout the corn belt. When kept in good condition and cut fine or shredded, corn stover is fairly satisfactory as a part of the roughage for dairy cattle. Fed whole, the cow does not get very great benefit from the stalks and resulting manure is very difficult to handle.

Hays may be divided roughly into two classes, the legumes and the non-legumes. To the latter class belong such ones as timothy, millet, prairie, and many others not so well known. Millet hay is perhaps the best of this group for dairy cattle feeding, since timothy and prairie hays do not tend to stimulate but rather tend to decrease milk production.

If possible, dairy cows in milk should be fed upon legume hay. This is desirable because of its protein and because it is palatable and stimulates milk production. The legume for use in any locality depends upon the climate and a number of other matters. In the West, alfalfa is the hay most largely raised, while through the East and Middle West red clover is the popular hay crop. Farther south are found cowpea, soy bean, and lespedeza or Japan clover hay. To say which is the best under all circumstances is impossible. Feeders of high producing cows, however, generally prefer red clover or alfalfa to the other legumes.

Succulent Roughage

For winter feeding succulent roughage in most northern sections of the United States means silage. Probably no single type of feed has done so much to increase milk production in the last few years as has this feed. Put up in the fall it furnishes a palatable succulent roughage throughout the year. The kind of silage depends upon the locality and the climate. For the great central section of country corn is the chief silage crop and science has yet to find a better. In other sections where corn cannot be grown or where other crops yield more abundantly, different crops are used. For many sections of the South, cowpeas or soybeans mixed with corn or sorghum makes the most satisfactory silage. In the dry southwest, sweet sorghum is a staple crop for silage. When the elevation gets too great or the growing season gets too short, sunflowers are used with success. Many other crops make good silage, and since silage is a necessity on any well regulated and economically operated dairy farm, some crop should be siloed.

In the vicinity of sugar beet factories it is frequently possible to obtain wet sugar beet pulp. When fed fresh in medium quantities, this makes a good succulent roughage. Care must be exercised to feed it fresh, since it spoils rapidly. Some cities have legislated against the use of moist pulp because so frequently the methods of feeding have caused insanitary conditions.

Perhaps the best substitute for succulent roughage is dried beet pulp. Soaked for several hours with about four times its own weight of water, it makes a juicy feed that is a very good substitute for silage.

Roots

Roots are in their general effect succulent roughage and serve the same purpose as silage. Because of the labor required in raising them, roots are comparatively little used for dairy cattle. They could well be used more widely, since in many respects they are superior to silage and are especially useful when large quantities of grain are fed.

The kind of roots varies with the region, mangels in general giving the largest yield. Red beets, half sugars, carrots, and turnips are also used with success. Turnips must be fed after milking and in medium quantities if the milk is not to be tainted.

Quantity of Roughage to Feed

The quantity of hay to feed is dependent upon the other feeds used. When it is fed alone, the cow should be given all that she will eat up clean. If silage and hay make up the ration the feeding may be as follows: Silage—from 3 to 5 pounds daily for every 100 pounds of live weight together with hay from 1.5 to 2.5

pounds per hundredweight. If grain is to be fed in proportion to production, along with silage and hay, the hay fed per hundredweight will vary from .6 to 1.5 pounds while the silage will range from 2 to 4 pounds daily per hundred pounds live weight. When fed with hay alone, the quantity of roots to be fed will vary from 4 to 6 pounds per hundredweight daily. If grain is added to the ration the quantity of roots is reduced to from 2 to 4 pounds daily per hundredweight.

These rules are not absolute, but merely guides for the inexperienced feeder while he is learning his cows and their capacities. Economic conditions also will influence the feeder to vary the relationship of succulent roughage to dry roughage. For example, if hay is expensive and silage cheap and abundant a larger proportion of silage may be fed.

Roughages Alone too Bulky

While it is true that a dairy cow has a digestive apparatus that is adapted for handling large quantities of bulky feed, there is a limit to the amount that she can handle advantageously. Since it is usually economical to feed the cow to the limit of her milk producing capacity the entire feed should not consist of roughage. Experience has shown that for maximum production a combination of roughage and grain is necessary. It therefore is the common practice to feed roughage in medium quantities and grain in addition in proportion to production.

[Mr. Davis concludes this practical feeding discussion in next week's issue of Hoard's Dairyman. He makes application of the information in this first article by examples of balancing rations and workable feeding rules.—EDITORS.]

Oregon Dairy Notes

HOARD'S DAIRYMAN:—Oregon dairymen continue to flock to the Oregon Dairymen's Co-operative League. The most recent additions to membership comprise the dairymen of the lower Columbia River country including particularly Clatsop county, a rapidly developing dairy district. The Clatsop County Dairymen's League as a body decided recently to affiliate with the state organization and turned over to its management their new cheese factory. Farmers interested in the Brownsmead Co-operative Creamery, also in Clatsop County, voted recently to affiliate and also turned their plant over to the League. This action places most of the Clatsop County dairymen in the ranks of the League.

In the Coos-Curry district marked progress in organization has recently been made, the local units having increased to fifteen. In Coos County the farm bureau is taking an active interest in the League and in some communities a part of the community program of work is the signing of a definite number of the neighborhood farmers to the League contract.

⚜

A. H. Lea has recently been appointed secretary of the State Fair for the fifth consecutive year. Mr. Lea recently resigned, but was persuaded to reconsider his decision. During his term of service, the state fair has greatly increased in scope and has been placed on an unusually sound basis.

⚜

The Northwest Ayrshire Breeders' Association has recently been organized with J. R. Mayben of Canary, Oregon, president and J. U. Smith of Newberg, secretary.

⚜

Richard G. Scott, for nearly three years the successful county agent in Clackamas County, has resigned to enter the employ of the Oregon Dairymen's Co-operative League as a field organizer. Mr. Scott is the second county agent from Oregon dairy counties to enter the employ of the League, the first being N. C. Jamison, formerly county agent in Washington.

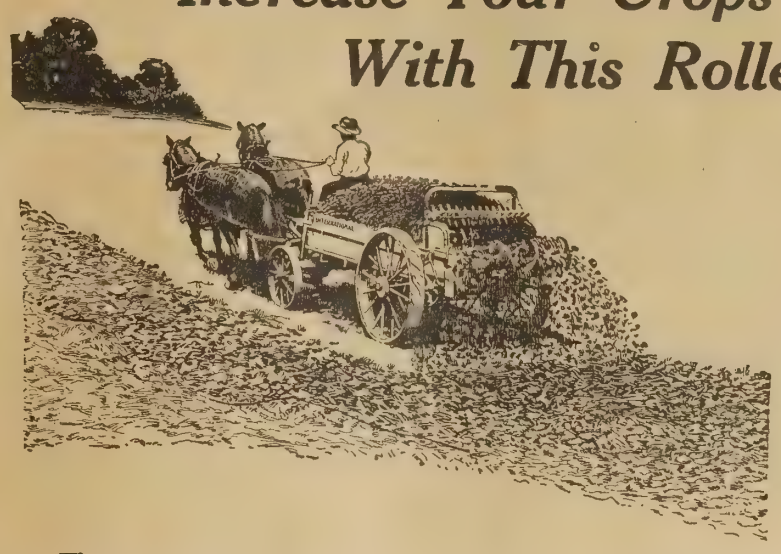
⚜

W. D. Pine, instructor in dairying at the Oregon Agricultural College, has taken up work as county agent for Tillamook County, succeeding Roy C. Jones who held the position for six years resigning to become assistant professor of dairying at the college. Mr. Pine is a graduate of the dairy department of the Oregon Agricultural College and has had extensive experience in dairy production in Humboldt County, California.

⚜

The twenty-five cheese factories comprising the Tillamook Cheese Association used more milk last year and made more cheese than ever before. Out of 301,579 cheese manufactured there were but 2,444 seconds, also the best record in the history of the association.

Oregon. F. L. BALLARD.



Three New Guernsey Records

Westbrook Ultra Rose, a daughter of the world's champion Guernsey cow in class BB, has qualified for fourth place in class GG. She is owned by G. W. Koser of Pennsylvania. Her production is 13,131.7 lbs. milk containing 621.99 lbs. fat. She and her dam are two of the first three cows tested in Mr. Koser's herd.

Two very creditable records have been completed by Guernseys on Kathergay Farms, New York. Enola's Edith has completed a record of 12,552.8 lbs. milk containing 659.43 lbs. of fat, in class BB, qualifying for seventh place.

Kathergay Rose now holds sixth place in class CC with a production of 12,217.9 lbs. milk containing 618.50 lbs. fat, her record being completed in the junior four-year-old division and a calf being carried 265 days of her testing period.

Increase Your Crops This Year With This Roller-Bearing Spreader

The year 1920 witnessed a most remarkable demand for International Roller-Bearing Manure Spreaders. The insistent call for them was far in excess of the supply; in many localities five could have been sold for every one available.

Popularity and fame like this can grow out of one thing only—and that is sheer merit. The record of the International Manure Spreader, in the improved type, promptly showed the farming public that here was a product of especial features and especial value. Factors that combine in creating that value are detailed on this page. These factors, from roller bearings on down, must be of practical interest to every man on a farm.

Months of effort, in material supply and manufacturing, have raised the production of these spreaders to a point where demands may be met. This is a year when you must go after increased crop yields with all tested methods—and the roller-bearing International is at your service. See the spreader at the International Dealer's or write the Chicago address for information.

FEATURES IN

International Manure Spreaders

1. *Roller Bearings*—Roller bearings at 7 points—the only spreader so equipped.
2. *Double Ratchet Drive*—Walking beam transmission from main axle eccentric and extra large ratchet wheel give easy, strong, steady feed. Box tapered to eliminate friction on both sides. Six feed speeds.
3. *Oscillating Front Axle*—Auto-type, permitting short turn. No pole whipping.
4. *Power; Both Wheels*—Power is transmitted from both ends of the rear axle—beaters and wide-spread driven from one wheel and the manure feed from the other.
5. *Wheels Track*—Rear wheels track with the front wheels, lightening draft.
6. *Tight Bottom*—There is no clogging, jamming apron, because the spreader has a tight bottom. Spreads anything.
7. *Two Beaters*—Two all-steel beaters with chisel-pointed square teeth work from both top and bottom of the load.
8. *Wide-Spread*—The spiral behind the beaters gives the manure a third beating, and spreads it finely and uniformly beyond the wheels.
9. *All-Steel Main Frame*—Wood box sides hold only the load.

Save on Sweet Clover

Half the Price of Alfalfa or Red Clover

WRITE for our prices and FREE Sample before you buy. We have the genuine White Blossom Bi-ennial. Tested for purity in our Seed Laboratory. Positively the best you can buy. And we save you money on the price. Wonderful improver of run down, badly washed fields. Will grow where alfalfa fails. Cows feeding on it, give big increase in milk supply. Richer in protein than either alfalfa or red clover. Grows anywhere and gives early Spring and late Fall crops—just when green feed is scarce.

Write TODAY for prices, generous FREE SAMPLE and free book.

Atchison Seed & Flower Co.
Atchison, Kansas

Free Catalog in colors explains how you can save money on Farm Truck or Road Wagons, also steel or wood wheels to fit any running gear. Send for it today.

Barn of Wm. T. Nolin stockman and breeder Stony Creek, Illinois

Fast becoming the standard barn roof—

Johns-Manville Asbestos Shingles laid the hexagonal method

TODAY there are so many barns and so many farm buildings roofed with Johns-Manville Asbestos Shingles, that farmers realize that more than style or newfangled notions lie behind the choice of this permanent stone roof.

Economy is the chief reason

Do you realize that Asbestos Roofing, either in shingle or roll form is the most economical of them all? Its first cost is slightly higher than short-lived materials but, over a long span of years, Johns-Manville Asbestos Roofing continues to serve as a weather-tight and wear-resisting roof covering, without the need of painting or other protection. It is hardly necessary to mention its fire-safety which is, of course, taken for granted with the word "asbestos." You can readily understand why these properties are present in Asbestos Roofing when you know that it is made of stone—asbestos rock.

Asbestos rock differs from other rock formations in that it can be split up into rock fibres—strong and silken. These rock fibres are felted together and water-proofed with natural asphalt, making an all-mineral roofing which from its very nature can neither decay nor disintegrate.

Lay them right over the old wooden shingles

JOHNS-MANVILLE Asbestos Shingles can be laid this way and we recommend it without reservation. It is not only the most economical way to re-roof, saving as it does the labor and expense of tearing off the old roof, but it is also the most practical, since you have in the old shingles that much additional insulation and protection.

But the booklet explains all this—and more. Write for it.

Because it is stone it is permanent

Absolutely impervious to rain, snow, sleet, winter cold or the rays of the hot sun, Asbestos Roofing shields your building from the elements year in and year out. There are Johns-Manville Asbestos Roofings everywhere that have seen service for decades and still the test is not long enough to decide definitely the average life of an Asbestos Roof.

Johns-Manville Roofings

Johns-Manville Asbestos Shingles, Colorblende Asbestos Shingles, Asbestos Built-Up Roofing for flat roofs, Asbestos Ready to Lay Roofing in roll form, Asbestos Corrugated Roofing. *All these Johns-Manville Roofings are approved by the Underwriters' Laboratories, Inc.*

Northern Substitutes for Corn Ensilage

W. P. KIRKWOOD, MINNESOTA

SUNFLOWERS, potatoes, clover and timothy, millet, sorghum, and peas and oats have all been found useful as substitutes for corn silage, in the feeding of dairy cows at Minnesota's northeastern agricultural experiment station near Duluth. Sunflowers, however, seem to give the best results, according to the statement of M. J. Thompson, superintendent of the station, in summing up the results of certain feeding tests carried on in 1919 and 1920. This opinion is based on the facts that for the three seasons in which sunflowers have been grown at the station no damage from frosts has been experienced because the sunflowers have matured early enough to escape the severe fall frosts and they have been hardy enough to withstand the earlier frosts; that the sunflowers are rich in oil and fat content; that on silage made from them the milk flow is maintained at a high average. A man operating a dairy adjoining the station reports that the milk production of his herd of 150 cows increased by 40 gallons per day on sunflower silage. However, there are good things to be said also for potato silage, clover silage, millet silage, and the rest.

In preparing for tests with the various silages named, the crops at the Duluth station were planted and cared for in the usual manner and the silage was put up in the ordinary way. The feedings of these silages were begun in December. Rutabagas were fed as a check. The plan originally was to feed the cows for a 14-day period on each kind of silage, but because of some necessary readjustments it was found convenient to omit for the time the feeding of the sunflower silage. As the test was worked out, two cows were fed roots (rutabagas) as a check and silages made from sorghum, peas and oats, potatoes, and millet, each kind for 14 days, and two other cows were fed rutabagas as a check and clover silage. All of the cows were Guernseys. Here are the milk production figures in pounds:

Name of cow	Roots	Sorghum	Peas and oats	Potato	Millet	Clover
Mimosa	16.65	14.13	13.40	13.20	13.45	
Angeline	14.02	14.00	12.74	12.66	12.60	
Antona	19.38					18.90
Antonette	25.10					24.50

The acre yields of silage crops at the Duluth station for 1919 ran as follows:

Crop	Pounds
Siberian millet	10.818
Common millet	10,147
Golden millet	20,190
Hungarian millet	12,491
Peas and oats	9,528*
Sorghum	31,153
Sunflowers	36,666

*Peas and oats were sown about July 1 in dry weather, following another crop.

In the light of the facts shown by these tables and by subsequent tests as to the use of sunflower silage, the opinion at the station is, as already indicated, in favor of the sunflowers. However, some of the other silages are not to be ignored in the dairy or live stock ration in climates where corn cannot be depended on.

Perhaps special interest will attach to the attempts to use potatoes. It should be said that potato silage is made from refuse stock. The potatoes are run through a root-cutter and then put into the silage tank mixed with from 2 to 5 per cent corn meal in alternating layers. The cattle eat this readily and it maintains the milk flow at the normal rate. Smaller quantities of potato silage than of some of the others may be fed because it is so rich in food value. Feeding can be begun about three weeks after the silage is made. Mr. Thompson regards the use of potato silage as one of the most economical ways of disposing of what is often an almost waste product.

Clover and timothy silage, it is felt as a result of the tests, has a place in the northern grass country—the entire cut-over country of the lake states, because in September there is usually an aftergrowth of grass and clover. This is difficult to cure as hay at such a season but may be readily put into a silo, being all the better if it is put up in the rain. Although dark in color, little of it spoiled in the Duluth tests and the cattle developed a keen taste for it.

Possibly the disadvantages under which the peas and oats got their start may have had something to do with the low yield and with the feeding quality. The cattle did not take to peas and oats silage readily. While both elements of the combination do well in the region, the crop is often hard to handle and the harvest for it comes at an otherwise busy period. The crop must also have an ample rainfall.

Sorghum has some of the disadvantages of corn. For best results hot weather is needed. Yet it has a high food value and the cattle like it well, and on it they maintain production at a high average.

The millet silage seemed the least satisfactory of all, being rather coarse, dry, and woody, and consequently lacking in palatability. Still Mr. Thompson believes it may have a place in such regions as his both for hay and for silage, because of its rapid growth. It makes the best silage when cured before the stem grows woody.

All things considered, then, Mr. Thompson feels that northern substitutes for corn silage are a success. He emphasizes the point, too, that between the beginning and the end of the tests two and one-half months elapsed, and yet the average milk flow showed a level which was off the normal only about a quart and a half a day.

New York G. L. F. Exchange Meets

HOARD'S DAIRYMAN:—After the registration of members of the G. L. F. Exchange had been accomplished at the recent stockholders' meeting in Utica, the president read his address. This, he said, was simply a review of the year's work, although the Exchange has actually been in operation a shorter time than that. These, as he states, are difficult times. This is a non-profit organization and for the benefit of farmers. In its present form started last July, it has purchased a building in Syracuse and another in Buffalo. At the latter place there is a mill and storage and there they will soon be mixing their own feeds. They will also have a dry house where they can take dampness out of grains.

A subsidiary organization has been formed called the Producers' Warehouse Company with the same stockholders as the G. L. F. By means of this organization commodities can be stored, upon which ware-

house receipts may be issued for use as collateral at banks. This method is recommended by the bankers' association.

While the Grange Exchange operated for some time successfully in a small way, it was not until last October that the larger G. L. F. commenced to operate. The year, however, shows marked progress. It is now for local development and support to determine what the success shall be, but the prospect is encouraging.

The secretary, E. C. Wetherby, cleared up several matters. One million dollars was the goal of stock purchase. A little less than $700,000 has been subscribed to date, of which about $163,000 was in cash. Fifteen counties subscribed their quota or more. The others are in various stages of the work and it is estimated that by July first the whole will be raised. Twenty-four counties have agents completing arrangements for local action. This means the possession of locally controlled warehouses by the local people.

The treasurer, when called upon, announced that a certified accountant had been employed to go into the books and to appraise the property. The accountant gave a detailed report of his findings. Like all handlers of similar commodities the falling market has cost the Exchange something. This was read in the report at about ten thousand dollars. At the same time there has been $18,000 made on goods handled. Moreover, the appraisal value of the buildings owned exceeds the cost of the same by about $20,000.

The manager, Mr. Hall, gave a very interesting report. The sales for the year 1920 totaled $1,369,349. Nearly half of this has been in feeds. Binder twine also has been a very large item and, as many remember, the Exchange price on this commodity brought down the price of all dealers to aggregate a very large sum. The old Grange Exchange from the first of the year to June did somewhat less than a half million dollars' worth of business. The balance was done from June to December. There is also a very large volume of business booked but not shipped. The wool pool has at least $200,000 worth of wool stored in the Syracuse warehouse.

The State College of Agriculture has had a close relationship with the Exchange from its start. For a time at its beginning, Professor Wing was the president and Professor Savage has given much advice in relation to feeding formulas and feed questions. Professor Barron has been the authority on seed selection and Professor Warren has assisted in the way of administration, advice, and management.

New York. H. H. LYON.

Red River Valley Holstein Sale

One of the first Middle West Holstein sales of importance in 1921 was the Red River Valley Sale held at Crookston, Minn., Feb. 9, and, if we may judge coming sales by this one, Holstein breeders can expect a series of successful sales this spring.

The Red River Valley, it should be noted, is one of the coming Holstein districts of the Northwest, and that black and whites are in demand there is evidenced by the sale figures; 47 head sold for $20,513, an average of $436.

Six animals sold for $1,000 or more with $2,500 the top figure. C. L. Spaulding paid this for Edenvale Bertha Ormsby, one of O. J. Grover's consignment.

The sale was under the management of the Minnesota Holstein Breeders' Association.

Following is a list of those animals selling for $300 or more and buyers:

I. H. Sargent, Minnesota	
Miss Korndyke Pontiac Lass	$400
Grahamholm Colantha Elcey Aaggie	310
Geo. Peterson, Minnesota	
Laura Segis Ormsby	$305
Ed. Fleckenstein, Minnesota	
Lady Artis Snowball	$500
P. M. Cameron, Minnesota	
Miss Pietertje Hannah Beets	$350
C. L. Spaulding, Minnesota	
Edenvale Bertha Ormsby	$2,500
Laverta Ormsby Susie	800
J. M. Brodrick, Minnesota	
Dinah Bess Ormsby	$1,010
Bess Pietertje Ormsby 3rd	1,800
W. E. McKenzie, Minnesota	
Lady Spring Grove Clothilde	$325
Agnes Clothilde Queen Segis	300
H. L. Marsh, Minnesota	
Jennie Pietertje Ormsby	$300
J. E. McMahon, Minnesota	
Mustinka Johanna Pearl 2nd	$525
Mercedes De Kol Korndyke Lady	828
Bess Burke Colantha	1,025
E. C. Schroeder, Minnesota	
Eli Belle Vale	$300
T. E. Gullings, Minnesota	
Hacker Maplecrest Pontiac De Kol	$310
Maud Pontiac Silvercup	350
Bernice Pietertje De Kol Homestead	300
Reaction Queen Ontonagon Segis	325
A. R. Knutson, Minnesota	
Edenvale Chief Ormsby	$525
Sloan Bros., Minnesota	
Johanna Olathe Bonheur	$1,010
I. H. Ruetell, Minnesota	
Permelia Cornucopia 2nd	$375
Fish Lake Abbekerk Ormsby	350
Cecil E. Julian, Minnesota	
Snowflake Rose Clothilde	$400
Olson and Johnson, Minnesota	
Queen Colantha Zubrod	$310

Iowa State college claims most students in agriculture, giving second place to Cornell, and third to Oregon. The rest of the first ten in order are Wisconsin, Ohio, Illinois, Massachusetts, Michigan, Nebraska, Pennsylvania.

Dainty Desserts and Salads

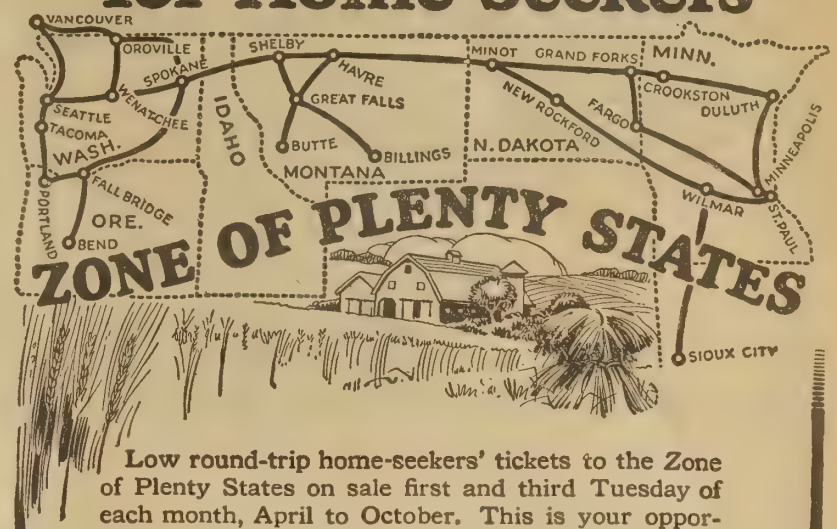
For the latest things in Jell-O desserts and salads let us send you, free, the "Jell-O Book." It gives the newest and most popular recipes for the famous desserts and salads that are so much in vogue just now.

A great variety of desserts and salads is made of each of the six different flavors of

JELL-O

You do not have to *cook* to make any of them, but only dissolve the Jell-O powder in boiling water.

For a few cents you can serve six or more persons with one of the most delightful desserts or salads.



The flavors are: Strawberry, Raspberry, Lemon Orange, Cherry, Chocolate, 2 packages for 25 cents.

Jell-O is sold at any grocery or any general store. If you cannot get Jell-O at the store where you trade we will supply you direct by mail at the regular price, paying postage ourselves.

THE GENESEE PURE FOOD COMPANY
Le Roy, N. Y.

Low Round-Trip Tickets for Home-Seekers

Low round-trip home-seekers' tickets to the Zone of Plenty States on sale first and third Tuesday of each month, April to October. This is your opportunity to look over some *real* country, abounding in fertility and adapted to every phase of farming and stock raising. Middle Western renters, especially, will find in the Zone of Plenty States the home-farm so long desired.

Minnesota

Farming in Minnesota means good crops and low-priced lands. The cut-over lands in Central and Northeastern Minnesota offer great opportunities in diversified farming, grain growing, potatoes and dairying. Clover and cows will support the family while the land is being cleared. The prairie section of the Red River Valley of Western Minnesota contains vast areas of rich, black soil where all kinds of grain, corn, alfalfa, clover and live stock are produced successfully.

North Dakota

North Dakota has the largest body of rich, black, low-priced lands in the country. Smooth fields, easily farmed, well adapted to working tractors. Stock growing has opened a new era in North Dakota. Wheat, small grains, alfalfa, red and sweet clover all are money-making crops.

Montana

Montana has millions of acres of grain-growing lands at low prices on favorable terms. This state has exceptional stock-raising advantages combined with grain farming. Irrigated valleys insure big production. Dairying, diversified farming and fruit growing on cut-over Western Montana land. A substantial start can be made here on small capital.

Washington

Washington and Northern Idaho offer a wide range of farming activities. Good crops of grain, forage, vegetables on low-priced land. Also adapted to dairying and mixed farming. Building material and fuel cheap. Water abundant. Climate delightful. Commercial fruit production highly developed under irrigation.

Oregon

Oregon offers vast farming possibilities combined with attractive climate. Low-priced irrigated land east of mountains. Diversified farms, west of mountains, produce fruits, berries, mixed crops and dairy products.

Investigate Zone of Plenty States Without Delay

Good farm lands in Illinois, Wisconsin, Iowa, Nebraska and other Middle Western States have advanced so high in price that today it is practically impossible for a man of small means to get started or the small farmer to insure a home and good income to his family.

To help you to a new home in the land of proved opportunity, the Great Northern Railway maintains an Agricultural Department. Complete information furnished FREE. All you need to do is to ask and details of the Zone of Plenty States will be promptly forwarded without charge. Send for state bulletins.

Association Notes

Canton, Pennsylvania:—In spite of the uncertainty of the dairy industry, interest in the testing association remains as keen as ever in this locality. There are now 36 members in this association, 8 of which are new. Three per cent market milk in January sold for $3.08 per cwt. and 4c per point above. The creamery paid 66c per lb. for fat. Milk retails for 14c per quart and butter for 65c per lb. Feed prices: cottonseed meal, $45 per ton; oil meal, $50; gluten, $56; wheat bran, $43; corn meal, $38; corn and oat chop, $42; Unicorn Dairy Feed, $59.

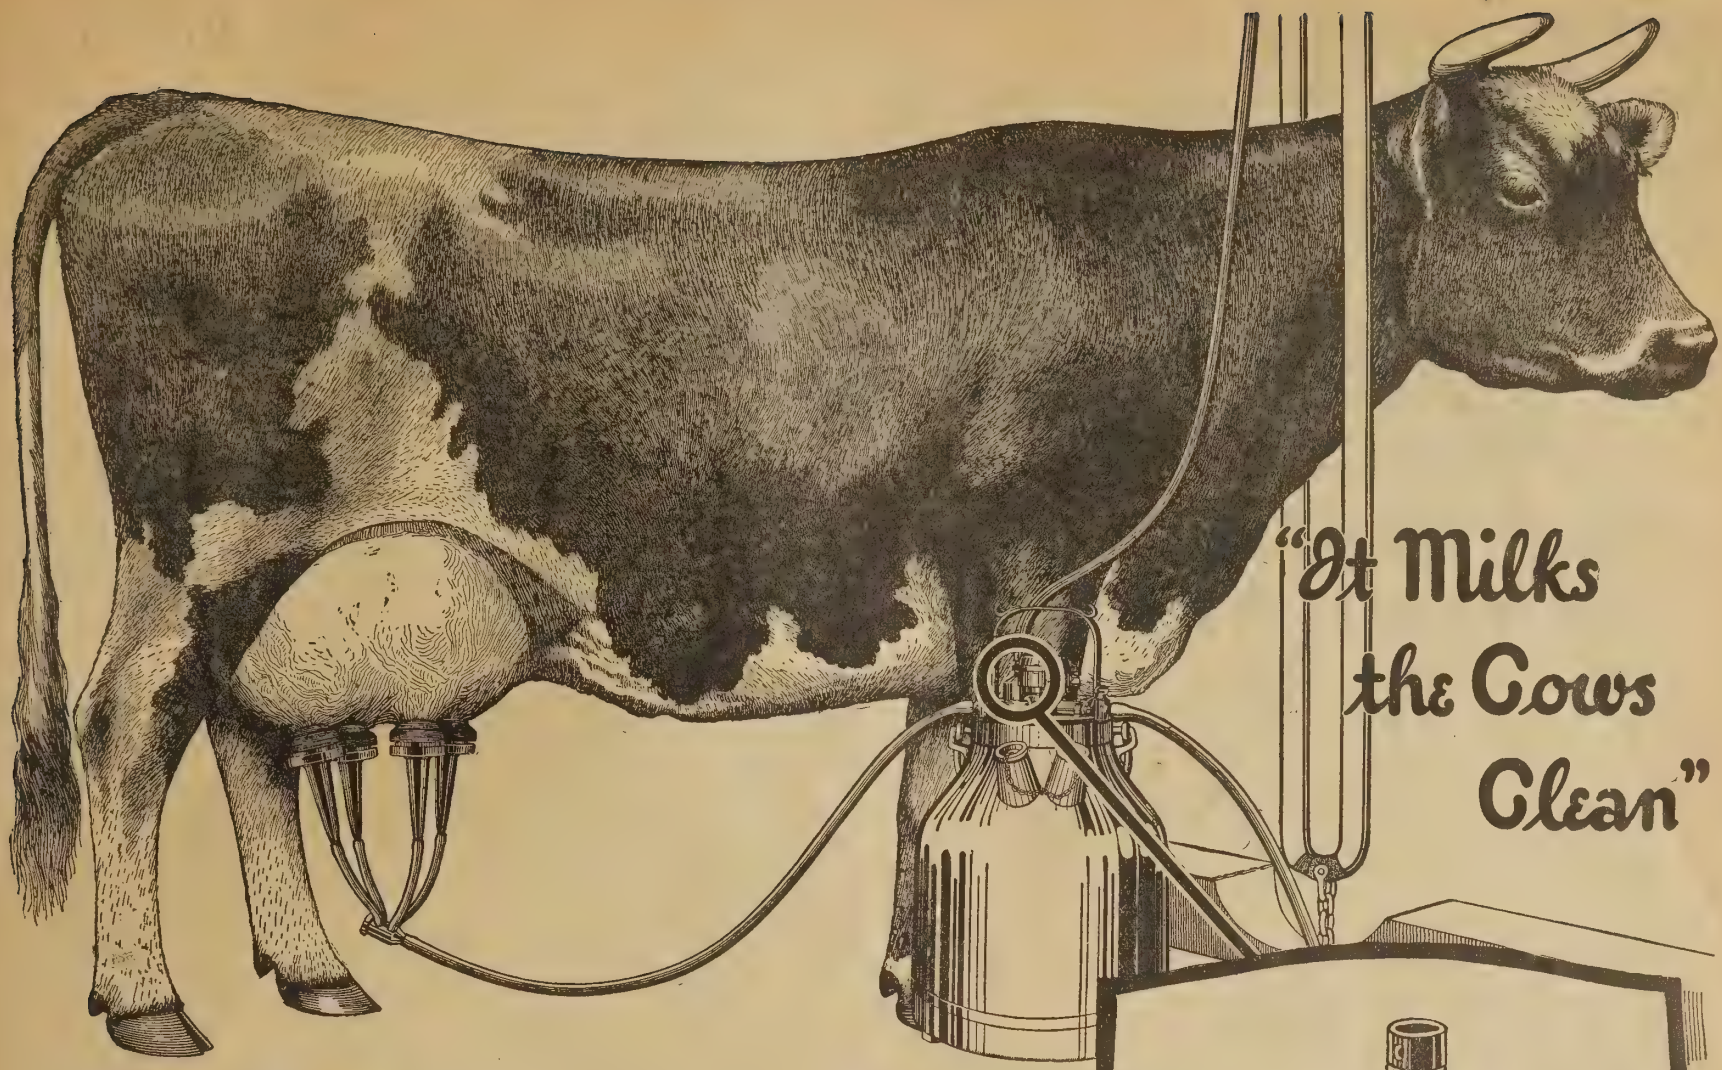
Merrimac Valley and Strafford—Carroll, New Hampshire:—Several members have taken up feeding of balanced rations and large improvement in condition of the herds and milk flow is noted. This association has a very active grain organization which is doing considerable to help the dairymen. They buy and mix their own grain. Cows are doing remarkably well this winter, due, probably, to the mild weather. Market milk delivered to the Boston market sold for $4.19 per cwt., a test of 3.7% being required. The creamery paid 52c per lb. for fat. Milk retails for 15c per quart and butter for 60c per lb. Feed prices are: Bran, $42—$50; gluten, $58—$63; cottonseed meal, $46—$58; oil meal, $51—$70; ground oats, $43—$51; corn meal, $40—$45; hominy, $52; middlings, $40—$52; siage, $10; first quality hay, $25.

Butler Road, Ohio:—This association is doing official testing and is making some very fine records. January market milk testing 3.5% sold for 31½c per gallon. The condensery paid 52c per lb. for fat. Feed prices are: Bran, $30 per ton; corn, $18; oats, $35; oil meal, $42; cottonseed meal, $56.

Posey—Gibson, Indiana: — One member sold 26 unprofitable cows. Two herds are now on the federal accredited list. All but three herds have been tuberculin tested. Baby clinic milk is being supplied by one member at a premium. An A. R. record of 576 lbs. fat has just been completed. January market milk testing 3.5% sold for $3.20 per cwt. The creamery paid 47c per lb. for fat. Milk retails for 15c per quart, butter for 60c per lb., and cheese for 40c per lb. Feed prices: Corn and cob meal, $18 per ton; bran, $35; oats, $34; cottonseed meal, $40; oil meal, $42.

Richfield, Wisconsin:—This association has just finished its first year of testing. Of the 370 cows tested, only 265 finished the year's record, 35 having been sold as breeders, 43 as unprofitable, and 8 having died. The average for twenty-five herds was 7,479 lbs. of milk containing 269.2 lbs. of fat. Twenty cows qualified for the Register of Production. The high cow, a pure-bred Holstein owned by Ambros A. Wiedmeyer, produced 14,456 lbs. of milk containing 497.1 lbs. of fat, earning a profit above feed cost of $217.21. Fred Hembel's Guernsey cow produced 465.1 lbs. fat at a profit above feed cost of $228.66. The six high herds average $2.39 for every dollar invested in feed.

Ambros A. Wiedmeyer says: "I will gladly tell you just what benefit I received from the Richfield Cow Testing Association. It interested me more than any other organization. It made me take interest in my cows and made me feed better to get a higher production than my neighbors, and for that reason I received a larger profit for the feed consumed, as I am convinced that the last pound is the one that brings the most profit. I also found the good and bad cows in my herd, which gives me a chance to clear my barn of poor paying cows and to secure a better price for the good ones."



Monticello, Wisconsin:—One pure-bred Holstein bull was purchased during January. One member has increased the production of his herd by feeding a balanced ration instead of only oats. Feed is being bought by the carload through the association secretary. January market milk testing 3.7% sold for $2.20 per cwt. and 6c per point above. The condensery paid 45—48c per lb. for fat. Milk retails for 10c per quart and butter for 50c per lb. Feed prices: Oats, 50c per bushel; corn, 65c; alfalfa hay, $26——$30 per ton; bran, $28—$36; oil meal, $48; silage, $8.

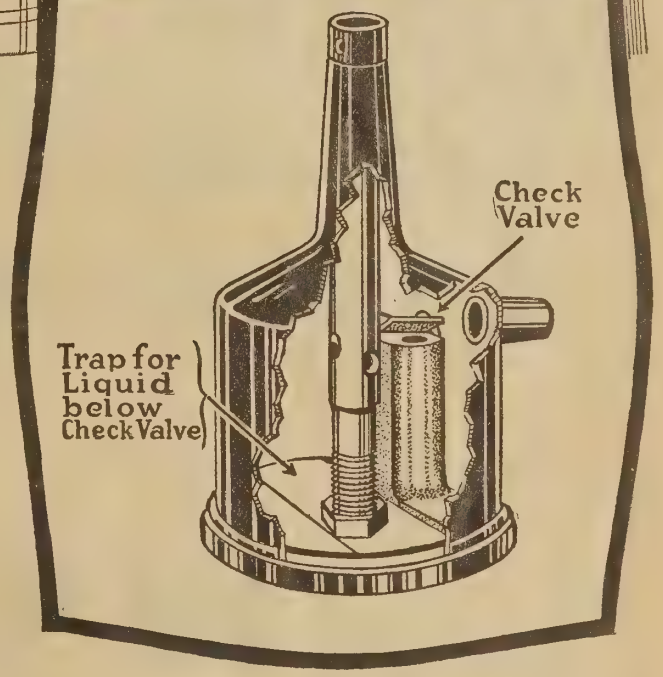
Arkansaw, Wisconsin:—Two herds were tested for tuberculosis and others are awaiting the tester. Three cows were sold to the butcher. Most of the members are feeding balanced rations. Bran sells for $28 per ton; oil meal, $45; mixed and clover hay, $15; corn, 74c per bushel; oats, 42c.

Riverside County, California:—Eighteen cows have been culled from herds in the association during January. A dairy demonstration was held at the A. M. McKersie dairy, Hemet, with an attendance of 118. Dr. J. E. MacMillan of the California State Department of Agriculture spoke on "Dairy Diseases" and F. H. Scribner spoke on "Selecting a Dairy Cow". This is a fruit section but the dairy herd is becoming recognized as a means of supplyng fertilizer for the orchards.

Southwest Washington: — Three pure-bred cows replaced three scrubs, and a pure-bred bull with dam's rec-

(Continued on page 326)

"It Milks the Cows Clean"



The Burrell Moisture Trap

THE Burrell Moisture Trap is absolutely essential to the production of *clean milk of low bacterial count.*

With any milker, during the milking, the space in the pail above the milk is filled with vapor and spray. Some of this vapor is drawn into the tube which leads to the vacuum pipe, and is condensed there. It then becomes contaminated and, unless prevented, runs back into the milk. A common check valve or an ordinary trap would not prevent this.

The Burrell Moisture Trap is so constructed that it is impossible for this contaminated liquid to get into the milk. Observe the illustration on the right. The check valve is located on a standpipe above the liquid in the trap. The trap catches the liquid and the check valve prevents an inrush of air from carrying it into the pail.

Study the Burrell Milker and its many exclusive features. Beside the Burrell Moisture Trap, you should know about the Burrell Positive Relief Pulsator, the Burrell Automatic Controller, and the Burrell Universal Teat Cup—they mean much to you.

Write for our booklet and complete information. Tell us how many cows you milk and why you are not already milking by machine. Use the coupon below.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, MARCH 3—A summary of the work of the sixty-sixth congress is not amiss. The summary, in so far as it has to record legislation of interest to agriculture, will not be a long one. One single bill asked for by agricultural interests, and not by all of these interests, is to be pointed out, the Joint Resolution under which the War Finance Corporation was revived and given authority to render assistance in financing foreign commerce.

The Packer bill was killed by differences between the Senate and House bills, and the activity of the packer lobby aided by the refusal of Republican leaders to permit a vote, The Cold Storage bill in its final form was found to include transportation in refrigerator cars as cold storage, and to fix a time limit of ten days after which commodities must be labeled "Cold Storage", which turned dairy, poultry, and packer interests against it. The final blow was delivered by the American Farm Bureau Federation voting to oppose it.

The proper labeling of commercial feeding stuffs never got beyond the informal discussion period.

The emergency tariff bill, carrying items for the protection of butter and other dairy interests, and placing a twenty-six-cent-a-gallon tax on the materials from which vegetable imitations of butter are made, passed, but was vetoed by President Wilson and failed to pass over the veto.

The Capper-Volstead bill, making clearly legal the co-operative organization of farmers to sell their own products, a bill of greater interest to dairymen's organizations than to any other except the Pacific coast fruit marketing organizations, and fought as far as it went by the representatives of the great dairy and milk producer organizations, died in conference committee because of the emasculating amendment added by the Senate which the farmers' representatives would not accept.

But there are some things on the other side of the ledger. The Agricultural Appropriation bill carries the needed items for dairy investigations and work, although not what was asked for for buildings and equipment at the Dairy Experiment Station at Beltsville, Md. There is a big appropriation for eradication of tuberculosis. There are good appropriations for dairy extension work.

Oleomargarine interests were turned down hard and cold when they tried to open up the oleo question and get a law which permits coloring.

The sales tax was not considered by the Congress, a tax which means a double burden to every farmer.

The Farm Settlement Act which would have caused hundreds of millions of dollars to be thrown away on unwise and uneconomic reclamation of lands to come into competition with the farms created by the toil and exertions of hard working farmers, was held in committee with never a chance of passing it.

Although the tariff bill containing the dairy items did not become law, the dairy interests by a concerted and united effort brought the need of the industry for protection from cheap ocean freight rates and cheap labor abroad to the attention of both House and Senate, and convinced a majority in both houses, as shown by several test votes, of the soundness of their request.

The House of Representatives on Monday afternoon approved the Senate amendment to the Agricultural Appropriation bill authorizing the holding of a world Dairy Congress next year, and the President to invite delegates from foreign countries. This amendment, under the present House rules, had to be submitted to a vote of the House and this was done, this time carrying without a vote against it. The authorization without which the Congress could not be held is now safe, unless the fight over the free seeds item, which is bitter as usual, holds up the final passage of the bill.

The National Grange in a statement signed by T. C. Atkeson, Washington Representative, denies with some vigor published statements that the investigation of farm organizations by the Banking and Currency Committee was caused by attacks on the American Farm Bureau Federation by The National Grange. "Members of Congress and members of the Washington staffs of the farmers' organizations" know that no attacks of this kind have been made, says the statement. The statement quotes Chairman McFadden who in one hearing told just how the investigation came about and says there is nothing to indicate that any organization was responsible or made any charges or attacks. It then quotes from various witnesses to show that all were under investigation, and all four which maintain offices here were compelled to tell how much money they spent, and where they got it.

Purdue Dairy Night

More than 2,500 students, townspeople of Lafayette and West Lafayette, and dairy producers and manufacturers from over Indiana attended the annual dairy demonstration night at Purdue University February 23, in the university creamery. Plans for the demonstration night were in charge of the students' dairy club and all the work was done by the students.

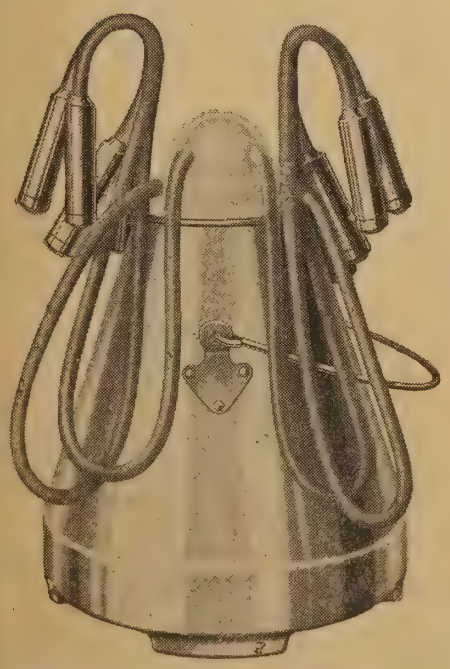
The creamery was operating at full capacity with all the butter, cheese, and ice cream machines in action. The public was shown all these departments and students in charge of various sections of the show explained how dairy products were handled.

One room was filled with nutrition products, showing samples of all the products of the Purdue creamery. Milk, cheese, and butter put to various uses were demonstrated, girls dressed in white showing how.

Another room was devoted to feeds for dairy cattle and in connection were shown miniature silos, dairy barns, and complete dairy farmsteads. A set of bacteriological surveys of milk were on display and proved of interest to the guests. Another room showed all the leading cream separators.

One of the rooms upstairs was fitted out in an attractive manner with furniture supplied by Lafayette business houses and an automatic lantern showed a set of interesting milk slides.

The demonstration is held annually and is designed to boost the dairy industry in Indiana.



Indiana. J. C. ALLEN.

Poor Cows Eat As Much As Good Cows

DAIRYMEN who want the largest percentage of return from their investments are improving the quality of their herds.

These progressive dairymen also recognize the importance of cleanliness, which assures milk of first market quality. They take no chances, therefore, of the milk becoming contaminated through contact with the air or the milker's hands and clothing. They use milking machines—and to be sure of the utmost cleanliness, they see to it that their machines are equipped with

WEAR-EVER ALUMINUM TRADE MARK MADE IN U. S. A.

"Wear-Ever"
Aluminum Milker Pails

"Wear-Ever" Milker Pails are made from solid sheet aluminum without joints or seams and are therefore easy to clean and keep clean. Light and easy to carry. *Cannot rust. Never need tinning.* Made of the same metal and with the same care as are **"Wear-Ever"** cooking utensils which are giving such thoroughly satisfactory service in homes everywhere.

The Aluminum Cooking Utensil Co., New Kensington, Pa.

In Canada, Northern Aluminum Company, Limited, Toronto.

Built for permanence and floored for comfort. A few of the stalls in the barn of Mr. Gustav Pabst, Dousman, Wis., where Circle A Cork Brick are laid in stalls and pens.

Permanence and Comfort in Stall Floors

ARE you one of those who think that a stall floor, to be durable and sanitary, must be made of some hard substance like concrete? A little investigation of other materials will soon convince you that it is not necessary to sacrifice comfort and safety to secure durability and cleanliness.

Ⓐ Circle A Cork Brick Ⓐ
FOR STALL FLOORS

for example, are almost as comfortable as the turf in the field. Easy and resilient underfoot and nonslippery, they eliminate all danger of stiff muscles, sore hoofs and bunchy joints and afford protection against injuries due to slips and falls. And yet a cork brick floor does not absorb moisture, hold dirt or retain odors. It is easily and quickly cleaned, conforms to every requirement of sanitation and lasts for years without appreciable wear or deterioration. Circle A Cork Brick combine in one material every essential of the ideal floor—safety, comfort, sanitation and durability.

These and other properties which distinguish Circle A Cork Brick as the modern floor for the modern barn are fully described in "Better Stall Floors," a 28-page book of unusual interest to breeders and dairymen, which will be sent free on request.

Association Notes

(Continued from page 322)

ord as two-year-old of 554 lbs. fat replaced a pure-bred scrub. One member who has started feeding to keep up winter production has increased 50% over last year with the same cows and with greater returns per dollar invested under grain feeding than ever before. January market milk testing 3.5% sold for 15c per quart. Milk retails for 16c per quart. The creamery paid 55c per lb. for butterfat.

Spread of Association Testing

HOARD'S DAIRYMAN:—From a modest organization of 31 members, owning 239 cows, in Newaygo County, Michigan, fifteen years ago, to 468 associations, composed of 11,948 herds representing 203,472 dairy cows, the progress of co-operative cow testing bespeaks the merits of the strict observance of performance at the pail of milk producers. Detecting unprofitable cows by accurately determining the relation between the feed bill and the milk yield as well as butterfat content has displaced the method of 20 years ago when the judgment of the milker was relied upon to distinguish between the "boarder" and profitable dairy animal. Memory, frequently tricky, emphasized the overflowing pail during the few brief weeks of the period of lactation while the judgment proved faulty in determining the year around yield.

Weighing of the feed dispensed to each animal, the determination of the milk yield, and analysis of the butterfat content are practices which have established the virtues of the co-operative cow testing association. The low producer is thus eliminated from the herd with unmistakable precision. From the single organization formed at Fremont, Michigan, in September, 1905, the movement has continued its forward march until 36 of the 48 states have acknowledged its possibilities by the formation of at least one cow testing association. Wisconsin, premier dairying state, is foremost in pledging strength to the movement, maintaining 115 associations, representing 3,429 herds and 52,879 cows. Pennsylvania, a state where boys' and girls' dairy clubs are strongly intrenched, has sustaining faith in the cow tester—having 64 units of organization, embracing 1,763 herds and 24,110 dairy animals.

Ohio fosters 41 cow testing associations, involving the supervision of 1,165 herds and unerring watchfulness of 11,806 cows as to their performances at the pail. New York, Illinois, Minnesota, California, and Vermont are credited with 28, 23, 19, 18, 18, organizations, respectively. Iowa, Michigan, New Jersey, Kansas, and New Hampshire, maintain ten or more units of mutual helpfulness where the Babcock tester, a shotgun can, and a spring balance are implements insuring efficiency in dairying. Virginia, Washington, Tennessee, Rhode Island, Oregon, North Carolina, Missouri, Maryland, Kentucky, Indiana, Idaho, Colorado, West Virginia, and Alabama maintain two or more cow testing associations. Arkansas, Connecticut, Delaware, Louisiana, Massachusetts, North Dakota, Oklahoma, South Carolina, and Utah subscribe to the employment of a cow tester to the limited extent of supporting a single association each.

The Dairy Division of the United States Department inquires: "Is cow testing worth while?" The question is first addressed to a fresh recruit of a cow testing association, whose infrequency in answering in the negative emboldens the dairy husbandman to propound the question to the dairyman who has realized the doubling of his profits by reason of his identity with the co-operative organization where knowledge is capitalized. His invariable reply is in the affirmative, emphasizing the merits of the cow tester. The breeder of pure-bred dairy cows, whose sale of a bull calf from a record cow for $1,000 is of recent moment, is as equally emphatic in proclaiming the benefits of scientific knowledge and mutual helpfulness. The conclusion of the Dairy Division, then, is:

"Cow testing is not worth while to the dairyman who makes no use of the records and who continues the doubtful practices of former years, but cow testing is worth while to the dairyman who desires to feed and breed according to known production. In dairy herd improvement knowledge alone is nothing, but knowledge followed by intelligent action is everything. To the man who belongs to a cow testing association, who studies the individual records of his dairy cows, and who selects feeds and breeds according to those records, cow testing is and always will be well worth while."

Washington, D. C. S. R. WINTERS.

What It Has Done for Me

The folllowing story of cow testing is told by Herman Kletzien, a member of the St. Nazianz, Wisconsin. Cow Testing Association:

"Two years ago a cow testing association was organized in this community and I joined to find out what my cows were doing. My herd of cows consisted of thirteen grade Holstein and Guernseys. They were just ordinary cows, giving a fair amount of milk and I was satisfied with them, but by their looks I hardly think they were satisfied with me. Their daily ration consisted of about 25 lbs. corn silage and 3 lbs. clover straw. I fed about 4 or 5 pounds of a mixture of ground corn and cob meal, ground oats and a little bran during three or four months of winter. Their milk flow was fair but there was no danger of their udders bursting.

"Here is an example of what one of my cows produced, a grade Guernsey weighing about 850 pounds. I looked upon her as being one of my poorest cows. The first year she produced 3,873 pounds of milk containing 216 pounds of butterfat. The next year we tested her again and this time she was fed according to what the tester told me she ought to have. I fed her about 30 to 35 pounds of corn silage and all of the clover straw she would eat as I did not have any good hay. The first of June my cows were turned on pasture and were on pasture until October when I started to feed silage again. However, I was feeding Baby grain the year around excepting in June when pasture was at its best. Baby received 4 to 12 pounds of grain a day just according to her production. The grain mixture consisted of ground oats, bran, and gluten with enough oil meal to balance up the ration.

"Now you will say, 'did Baby increase in production?' Yes, she did, My herd book shows that in the eleven months of the second year she has produced 6,888 pounds of milk containing 401.2 pounds butterfat.

"This is not the only cow in my herd to increase her production, for my herd will average about 100 pounds more of butterfat this year than last year. I chose Baby because I thought she was one of my poorest cows. Did it pay me to take good care of her? Did it pay me to join a cow testing association? Have you any doubts? **I assure you that I haven't.**"

Columbia Grafonola

"Come On Over"

"The bunch is here. And we're simply dancing our heads off . . . What? . . . Didn't you know? We have a Columbia Grafonola."

Parties fairly give themselves when you have a Columbia Grafonola. There's never a pause in the merriment to rush over and stop the motor, because the Columbia Grafonola has the *exclusive Columbia Non Set Automatic Stop*. Nothing to move or set or measure. Never stops before it should. Always stops at the very end. You can dance to the very last note of every record.

On Columbia Records you'll always find the latest dance hits played by the best dance organizations, because the best in the country make records for Columbia *exclusively*.

DODGE BROTHERS MOTOR CAR

The things which the average man wants most in a motor car are precisely the things for which Dodge Brothers Motor Car is celebrated everywhere

Wherever you go, owners will tell you that the qualities they most appreciate in Dodge Brothers Motor Car are the low cost of gasoline and oil, the high mileage they get out of tires, and the unvarying good service

People buy Dodge Brothers Motor Car because they know they can rely upon it

DODGE BROTHERS, DETROIT

CANAN, JERSEY FIELDMAN

R. D. Canan has been appointed fieldman for the Jersey clubs of Ohio, Indiana, and Illinois. He begins his work March 15th. Mr. Canan has previously been employed by Purdue University and has engaged in dairy extension work throughout Indiana.

He is a graduate of the Pennsylvania State College and of the University of Idaho. He has already appeared before the Jersey cattle clubs of Ohio and Indiana and has outlined such plans for the work of these clubs that he has been selected from a number of very capable applicants. He is well fitted for the activities which he now begins.

Milk Situation in Hawaii

HOARD'S DAIRYMAN:—The writer, having read of the milk situation in St. Louis, Chicago, and other cities where there is a big surplus of milk and where the dairies are working on an eight to ten cent margin for pasteurizing, bottling, and delivering, thinks the dairymen of the States may like to know what is happening in their sister state, Hawaii.

In the first place, the tables are turned when it comes to the supply of milk. Instead of the dairymen pouring their milk into the rivers, we in Hawaii are crying for more milk. The demand far exceeds the supply here during the "winter months".

The cause of this is fourfold, I believe: First, because of our warm climate cows imported from the States do not do as well as they did in their native states, such as Wisconsin; second, because of this fact the average production of dairy cows in Hawaii is only around seven quarts per day per cow; third, the lack of proper pasturage facilities, owing to our great sugar industry here very little land being available for grazing cattle; and, fourth, the necessity of feeding mostly all imported concentrates.

Because of these conditions the producer is paid a very high price for his milk as compared to that which is being paid in the States today.

We pay our producers, for milk testing 3.5 per cent fat, six dollars and forty-six cents per 100 lbs.; for milk testing 4.9 per cent, eight dollars and thirty-eight cents. This averages about fourteen and a half cents per quart. This at first may seem an exorbitant price but during the past year the dairymen, owing to the exceedingly high price of imported concentrates, have hardly been able to make ends meet. Now with the decline in feedstuffs he will be able to make a fair return on his investment which is certainly due him.

After reading this far you are no doubt pitying the poor consumer who, according to the time honored ratio of equal cost of production and distribution, would be paying about twenty-eight cents a quart. But this is not the case for the consumer is only paying nineteen cents per quart. Only four and one-half cent margin for pasteurizing, bottling, and delivering the milk to the consumer's door, while in most of the cities on the mainland the margin is from six to ten cents.—PAUL S. LOOMIS, Dairy Feed Expert, with Honolulu Dairymen's Association Ltd.

Cow Blankets

Here is the famous *Kant-Kom-Off* blanket endorsed by leading stockmen. Stays on ALWAYS. Can't be kicked off. Keeps cattle sleek, and a great fly protection. Write today for particulars. Ask about our FITS-ALL Show Halter. Address Dept. 96

Pooled Wool Moves

The importation of foreign wools has prevented any great activity in domestic sales but the American Farm Bureau Federation reports that 15 per cent of its pooled wools has been moved. There have been six million pounds sold from the farm bureau pools in the states of Ohio, Michigan, North Dakota, Iowa, Illinois, Wisconsin, Minnesota, South Dakota, Indiana, and Kansas.

The prices are about 40 per cent of last year's values. For quarter blood, the price per pound ranges from 20 to 28c, for three-eighths blood from 26 to 30c, for fine staple from 33 to 40c, and for low quarter from 20 to 23c. These prices are based largely upon what the same grades of foreign wool can be placed in the Boston market, for, under present conditions, the foreign wools very largely set the price.

Kansas State Dairymen's Association

The annual meeting of the Kansas State Dairymen's Association was held at Manhattan on February 8th in connection with the Farm and Home Week of the Kansas State Agricultural College. Both in point of attendance and interest this was the best meeting the Association has ever held. Subjects of vital importance were discussed by experts of national reputation.

F. L. Bouska of the American Creamery Butter Manufacturers' Association discussed the present butter situation and the relation of quality in cream to wholesale butter prices. He pointed out that in order that the producer shall receive a premium on cream of good quality, it will be necessary for local cream buyers to grade the cream at the time of delivery. The causes of poor cream and effective methods of prevention were discussed.

R. R. Graves of the U. S. Dairy Division spoke on "Prepotency of Dairy Sires" and emphasized the necessity for the selection of proven sires or of sires whose sires and dams in close up generations have proven themselves uniformly good producers or transmitters of producing ability.

A. J. Glover, editor of Hoard's Dairyman, discussed the future of the dairy industry. He believes the special adaptation of the dairy cow to economical production of the most essential of all human foods, and the fact that dairying fosters a system of diversified farming insures a continuance in the future of the prosperous conditions which have resulted in the past where dairying has been followed.

At a business session, P. W. Enns was elected president; R. C. Kreuger, vice-president; and W. T. Crandall, secretary-treasurer. The following resolutions were unanimously adopted:

Be it, Resolved that the State Dairymen's Association indorse the Accredited Herd Plan and urge that all agencies furthering that work be given hearty support. Further, that the association heartily indorse the bill now introduced in the legislature which requires that no milk or cream be sold for food purposes from cows not officially tested for tuberculosis unless the product is first pasteurized before being sold. Be it

Resolved that the State Dairymen's Association as a body and its members as individuals urge the various members of the state legislature to support the work of the Kansas State Agricultural College in general and of the live stock departments in particular with adequate appropriation for buildings, land, and other equipment. Be it

Resolved that the State Dairymen's Association is opposed to the placing of any tax on neutralized butter believing that such a tax will in the end be borne by the producers. Be it

Resolved that the State Dairymen's Association go on record as opposed to the removal of the office of State Dairy Commissioner from its present location, or if it is found that such a move is necessary that it be placed under supervision that is absolutely non-political. Be it

Resolved that the State Association indorse the bill governing the sale of oleomargarine within the state as introduced by the Kansas Creamery Improvement Association. Be it

Resolved that the State Dairymen's Association favor an adequate tariff on foreign dairy products and on imported vegetable oils as a protection for the home dairy industry.

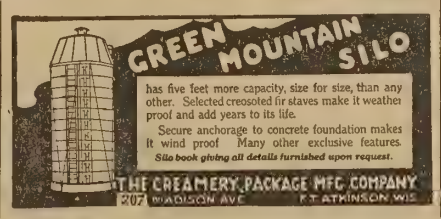
Kansas. W. T. CRANDALL.

Western Electric Power & Light

Makes The Battery Last Longer

Running the milking machine—one of the many pieces of farm machinery you can operate from the pulley on the Western Electric Outfit.

Why you should buy *Western Electric* Power & Light



1. It is an extra powerful Outfit.
2. It has a pulley that enables you to use your outfit as a powerful engine, either separately or at the same time you charge the battery.
3. All parts are easy to get at.
4. The engine runs on kerosene.
5. The "tapering charge" makes the battery last longer.

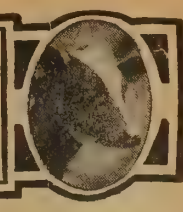
Ask a nearby Western Electric dealer about this dependable outfit

Plenty of Power and Light

Power to help in your work—saving you time, labor and money. Light to make the house cozier to live in and the outbuildings pleasanter to work in.

For information about the Western Electric Power and Light Outfit, write for Booklet HD-2, Western Electric Company, 500 So. Clinton St., Chicago, or 151 Fifth Ave., New York.

PERMANENCY



Is what you get in CORN BELT TILE silos. They are repair proof, paint proof, storm proof. Thoroughly glazed, beautiful in appearance, strongly reinforced. Include tile chute, feed room, steel back ladder and hip roof rafters. Discounts for early shipments.

Another Letter to the Home Folks

DEAR HOME FOLKS:—I guess you must be about ready for another epistle from your prodigal son. And prodigal expresses it, too, at least that is the way I feel when I think of dad and Jerry hard at work on the old farm and here I am galavanting about when I should really be there, too. This trip will last me for some time, that is, one like this I should say, and although the worst of it is over, I wish that I was back on the job. Well, it isn't going to be long now before I will be with you all again for we are now as far north as Washington, D. C., interviewing the president. Ahem! Guess there is some class to your oldest son, eh, dad?

I just hate to write letters, ma, and, believe me, if I thought the other one I wrote was not appreciated, I'd stop right here like a balky horse. But I suppose it was, eh, ma, and you can certainly consider yourself favored for the only two letters which I have written since I've been gone are the two which you are receiving.

Well, as I said in the beginning, we are now in the city of Washington, and we think that it is a beautiful place to live in. I wonder if yours truly will ever have that opportunity. Bob says that I will. He thinks that I am a born politician, but I guess he's wrong in his judgment this time. Of course, you never can tell and my mind is still set on being a real business farmer and they always tell us that all of the big men who get into the senate are farm bred. I don't know whether that is a qualification or not, but if it is, I sure can qualify on those grounds. Training under you, dad, ought to qualify any fellow for almost any position. Now that's not original with me, either, for Bob made that statement not less than half an hour ago when we are talking about it. But anyway, thanks for the course, dad, it may be the makings of me. We'll give you the credit when the time comes.

Now naturally you will all be interested in our trip from Thomasville up here and it was not without interest, either, for we made a stop of about a week at Hendersonville, North Carolina. And what an experience we had, too, in reaching this place. They say history repeats itself. Well, that isn't the only thing that can claim that kind of credit. I'm here to say that mud and mountains can do about as good a job along that line, at least as far as autos are concerned. I think that we must have left Thomasville before my first letter reached you, ma. We travelled straight through Georgia and on into the Carolinas. The night before we started, we got engaged in a friendly game of cards and before we realized it, it was one o'clock in the morning of the day we had planned to start. I was dead tired and rolled in as soon as I could. But Bob tried to kid himself that he wasn't tired, that he wouldn't sleep if he did go to bed and in spite of all that I could do and say, that rascal sat up the rest of the night, doing what I don't know, excepting that when he woke me up at four, I found all of my clothes packed and a hot breakfast waiting for me. Sounds like him, doesn't it, Jerry? Gee! but I did hate to get out and think about the long ride ahead of me. And it was long, too, for we made 230 miles that day and all done in a tin Liz. The trip to the northern boundary of Georgia was not one of any exceptional interest. We came through the peach section but the peach harvest was all over a month before this. We saw orchards of acres and acres of peach trees, so we judged that this must be quite an industry for this section. A place called Fort Valley seems to be the center of the section. We didn't encounter much trouble until we neared Greenville, and then, oh then, the mud on freshly worked clay roads!

But we made it, though, and we reached Greenville somewhere along eleven o'clock that night. Tired? Oh no! I really believe that I could have slept on the top board of the old barnyard gate, Jerry, without any fear of rolling off! I was that tired. Well, as I said awhile back, we had planned a stop in Hendersonville and since the two towns are not very far apart, forty miles I guess, we did not plan on starting out very early

SOON BE TIME FOR THE CHICKS, JUNIORS

the next morning, and it was fully eight o'clock before we were ready to go. They told us in Greenville that the road was well nigh impassable and that we couldn't make it. But that didn't scare us in the least after what we had already experienced. We were going to Hendersonville and to Hendersonville we got after some little trouble. Took us half a day to make it, the slowest time we made on any part of the trip. We tore along at a good speed for about half the distance and just when we were wondering what the Greenvilleites meant about bad roads, we saw the mountains ahead of us and it didn't take long after that to realize what their advice was worth. Mud and stony hills! That's a fair description. But I forgot to mention the holes. Yes, mud, stony hills, and holes big enough to bury our big bull, Jerry. Talk about our back pasture being stony. I feel like starting right in when I get back and clearing the few stones off after this experience with rocks. The only way they can ever have a road through this stretch is to pave it and where they will get the wherewithal, is more than I am able to say. But this I know, we were mighty lucky to get through as well as we did. We had one funny experience which is still a mystery to me. But it fixed her up all right and the worst part of it all was that we couldn't blame the car any. Now you are all wondering what it was. Well, you couldn't guess it if I gave you the remainder of the night. I took the long handled wrench we carried to turn the pet cock for oil testing and to my surprise when it was opened up, a stream of oil shot out acting as though it was glad to get away. Well, I just let it run until I believe about a quart had been disposed of. Then we tried her out. Away she went, as if she had a new lease on life and after letting some more off she was better than ever. Too much oil! That was all. Well, I blamed Bob and he blamed me, but I still think I'm on the right side of the argument, for he filled it with oil that morning. Well, it is a small matter now, but we were mighty glad that it was not something more serious.

Hendersonville is situated in the mountains. It is a summer resort and the town was filled with tourists waiting to get out just as soon as they could drive their big cars over those roads. And from all I know, many of them are there still waiting, for it rained nearly every day we were there. There is one advantage in driving a Ford at least; you don't have to wait for the weather to clear up, and when we were ready to leave we just pulled out, notwithstanding the fact that it rained all the previous day. Of course, we had some more mud troubles, but we were accustomed to that. We headed straight for Lexington, Virginia, and after the first half day's travel from Hendersonville, we found pretty decent going. The roads in North Carolina were good and we made splendid time.

We decided to make Lexington, because we wanted to see the Natural Bridge of Virginia and also for the reason that we both know a fellow we met in college who is from this place. We went through Buchanan, the birthplace of President Buchanan, and if presidents come from towns like this, look out for me, dad. There's some hopes that the name of Greene will be spoken about the White House! Anyway, that surely is a sleepy looking town.

Natural Bridge is quite a sight, but like all of Nature's wonders some one has gobbled up the rights to charge to see them and to me that takes away some of the pleasure. Not that the small charge amounts to anything, but it just kind a leaves one with the impression that there is something about it that is man-made. One really does not know when he has arrived at the bridge for the road leads right over the top of it. But a little way beyond, you soon realize that you are there for there are signs enough to attract the attention of an army. Well, you pay your entrance fee and after a descent down a number of stony stairs you see it in all its glory. The whole thing is the work of running water, and it is only when one sees sights like this that he realizes the power of water. There is a rapidly flowing stream underneath that is still continuing to cut away. It was just about noon when we arrived so that we were anxious to get away and on to Lexington which was but a few miles away.

Lexington is an interesting place. This is where the Virginia Military Institute is located, also Washington-Lee University and the Lee Memorial Chapel in whose vault are buried the remains of all the famous Lees. We spent the afternoon and night there and started for Washington, D. C., the next morning. The Military Institute had just opened up that week and we had an opportunity to see the boys at drill. It made me think of last year when I was taking military tactics at Madison, except that here they made it a real business to emphasize the making of soldiers. I pitied the green recruits, rats they call them in their first year, as I watched them learning the fundamentals on the parade grounds. Believe me, those cadet officers did work their companies. But I guess that is the only way to get them into the real spirit of the game. It was all interesting, but give me the agricultural college at Madison for mine. I'm satisfied with the training that we get there, and besides I have no aspirations for being a soldier in times of peace, but let war break out and I'm as ready to lick the enemy as any one else.

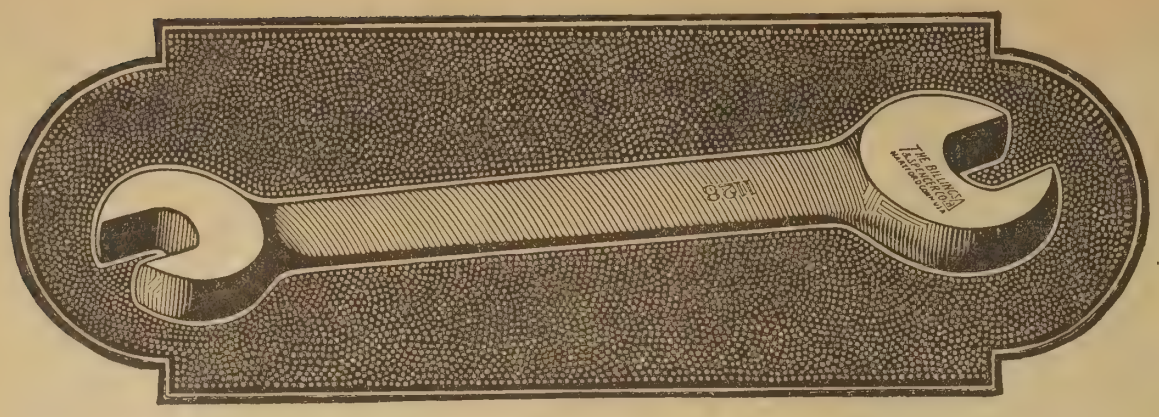
We left Lexington the next morning and headed for Stanton where we learned we would strike a hard paved road all the way into Washington,

(Continued on page 334)

A Profit-Maker For Many, Many Years

EVEN at double or treble its cost, the Hayes Four-Wheel Planter would be a wonderful investment. Ask any Hayes user if this is not true. The reason is simple. The Hayes Four-Wheel System of Human-Hand planting fills up the wasteful "bare spots." The first year it brings an increase that usually pays the cost of the Hayes Four-Wheel several times over. Then profitable increases continue for 18, 20, 25 and even 30 years.

This is not mere hearsay. Records of over 35 years on nearly 300,000 farms prove it.



As proof of our faith, we *guarantee* the Hayes Four-Wheel—guarantee it to *produce a better stand of corn.* This is the only *Big-Crop Guarantee* ever written, we believe, on a farm implement. It says that if the Hayes Four-Wheel fails to produce a better stand of corn you may return it *and the full purchase price will be refunded.*

You want a big corn crop. Why continue to lose bushel after bushel? The Hayes Four-Wheel is guaranteed *on a money-back basis.* Why wait? Order your Hayes Four-Wheel *now.* Next year's increase will more than pay for it. Then it will continue a profit maker for many, many years. See local dealer.

Hayes Pump & Planter Co., Dept. 14, Galva, Ill.

HAYES

FOUR-WHEEL PLANTER

WORK comes thick and fast in the field before the corn is laid by—no time to waste on balky wrenches or tools that yield to the pull of a husky hand.

Keep your machinery in shape with Billings & Spencer wrenches.

You will find them wherever good tools are sold.

More on Kudzu

HOARD'S DAIRYMAN:—I have read with interest the article in your paper on "Perpendicular Pastures", by Mr. Leach of Florida. I thought that I was enthusiastic, at times, over kudzu, but I take off my hat to Mr. Leach. I can appreciate what he says about the incredulous smiles of friends and I note that you throw a dash of cold water on the kudzu vine in your note, in which you issue the usual warning of editors, advising their readers against believing all they read in the prospectus, whether it be an oil stock, a new bean, or a new forage plant.

But I am interested in some of his suggestions, having had indifferent success in my attempts to grow the kudzu vine in various places and under various conditions. One is his suggestion of seven-foot fences, seven feet apart to make three acres of pasture on one acre of ground. I see no reason why it cannot be done, though I don't see why he builds the fences seven feet high. I don't know, of course, what kind of cattle they raise in Florida, but a cow that can eat vines off the top of a seven-foot fence is some cow. We haven't anything like it around here. The main point in his pasture scheme, I fear, will be the expense. He says to make the fence of woven wire, but from my observation it will take a mighty strong wire fence to withstand the pulling and hauling of a bunch of cows eating vines off each side of it. Nothing less than a good wire cattle fence would do it. To make a fence seven feet high would take two lines of 42-inch fencing, each twenty rods long, for his 330 feet mentioned, or forty rods of twenty rods each. This wire will cost, now, around $12.50 delivered anywhere in this part of the country. Five hundred dollars for wire. The 20 lines of fence will use up 600 fence posts, ten feet long and they must be good ones, costing forty or fifty cents each, say $250. The labor of building the fences will cost $150 and then will come the plants, care, etc., easily bringing the cost up to $1,000 for the acre, or, as he says, three acres of pasture. I don't wonder that you advise us to go slow and start on a small scale.

But that doesn't mean that the kudzu vine is not a wonderful plant. It is the first thing, of value, up in the spring and cattle and horses leave any other green vines for it when they have a chance at it. And grow? I guess it does. I have cut vines over forty feet long in the early summer, before the stuff had gotten half a start.

There is one suggestion of Mr. Leach that I can endorse, that is, kudzu as a cover crop for an orchard. A neighbor of mine planted, a few years ago, a few vines along a waste spot, where the vines could run over some wild persimmon trees and some other smaller scrub stuff and you ought to see that patch now. In the late summer and early fall it is a solid bank of vines about 100 feet long and 15 to 20 feet high, enveloping those trees in a mass of foliage about two or three feet thick until no sign of the original trees is visible from a short distance of twenty feet. Yes, sir, as a cover crop for an orchard it would be a success. I don't know of anything that would cover an orchard more completely nor do it quicker than a few kudzu vines well started on their mission. How one might go about the task of getting at the fruit, I am not prepared to say, but that is immaterial. This orchard proposition also offers another perpendicular pasture, though one might have to import a flock of camels or giraffes to utilize it to its fullest extent. But the fodder would be there for them all right.

Alabama. JOHN B. CHAPMAN.

Dairying Thirty Years Ago

Cows are selling in the dairy districts in New York for an average of $30.

⚜

Mrs. Rutledge, of Iowa, very wittily says that Rip Van Winkle left a large family of daughters and that they are scattered all over the country asleep like their father, churning with dash churns until both butter and back break, lifting heavy crocks of milk, feeding calves and pigs sour milk, swapping their poorly made butter at the country store for calico, codfish, and groceries.

⚜

An eastern paper says the East Monkton, (Vt.) Creamery closed the 15th of November. At that time in that state, milk was worth for butter, $1.29 per hundred. The action of the creamery in closing at that time was of course induced by the stopping of the milk supply from the farmers. The creamery will open business in the spring, and continue through the summer; when the average for milk will be about 70 cents. This illustrates the wrong of the exclusive summer dairying folly very clearly.

⚜

The Dairyman believes that the dairy farmer who exercises skill, brains, and perseverance to bring up a herd of cows to a profitable production is well and truly an artist. He has to exercise art as well as the painter or musician. Mr. Cau, of Boonville, N. Y., in a recent meeting gave the world the benefit of his thought and experience, as well as artistic ability. He says:

A farm well managed is profitable. I keep a dairy and forty-four cows, and can manufacture butter with profit at twenty cents. I made 285 pounds to a cow in 1889. I have set my mark at 300 pounds per cow, and expect to get the other 15 pounds. What the result will be this year I cannot tell until the first of January. The amount of money realized from each cow was $83.22 including the butter and the sale of pork, etc., fed on the skimmilk. I bought $1,126.49 worth of grain to feed the cows and hogs, an average of $25.60 per cow. This leaves a balance in favor of the cow of $55.62. The hay is not reckoned in. The beef I sold amounted to $667.50. My farm will average two and one-half tons of hay to the acre. Twenty years ago it would not raise one and one-half tons to the acre. I have 92 acres and hire as much more, with 10 acres of woodland.

EXPERT LUMBER SERVICE FOR THE MAN WHO WANTS TO BUILD

HERE is a service of the greatest practical importance to the family looking forward to owning its home.

To the farmer for his house, barns, corn cribs.

To the industrial man and corporation, planning expansion, replacements, repairs—or using lumber in manufacture.

A service that may add 100% to the value of your lumber purchase—whether you buy a couple of boards, a truck load of dimension stuff, or think in terms of millions of board feet to the single order.

This service means nothing less than expert advice in using the *right wood* in its *proper place*—based on detailed scientific knowledge of the various species of wood, their strengths, their fitnesses, and their individual action under specific conditions of use.

It may be a new thought to you, for instance, that in building a house lumber must be selected for three totally different functions.

There is the *framework*—which requires strength above all else.

There is the *outside finish*—demanding durability under exposure to the weather.

And the *inside trim*—where the need is for a wood properly seasoned and prepared, that will "stay put", and that will be attractive when stained, or will take and hold paint or enamel.

For each of these functions certain woods are especially adapted.

For some, cheaper woods will give as good service as more expensive species. In other instances, cheaper woods can be used only at a sacrifice of durability and ultimate economy.

The same principle—the *right wood* in its *proper place*—applies to farm buildings, industrial buildings, and all industrial uses of lumber.

The proper use of lumber was never more important to America than it is at this moment.

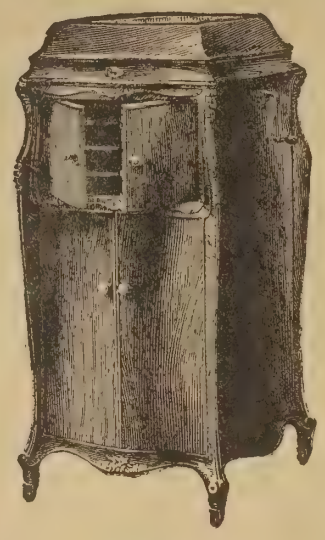
To the individual citizen it means durable and economical building.

To the nation at large it means still more—a great step toward an *ample supply of lumber*, present and future—the elimination of waste in the thoughtless use of lumber.

What we advocate is conservation and economy through the use of the right wood in its proper place.

To this end we will supply to lumber dealers and to the public, any desired information as to the qualities of the different species and the best wood for a given purpose.

This service will be as broad and impartial as we know how to make it. We are not partisans of any particular species of wood. We advise the best lumber for the purpose, whether we handle it or not.



From now on the Weyerhaeuser Forest Products trade-mark will be plainly stamped on our product.

When you buy lumber for any purpose, no matter how much or how little, you can look at the mark and know that you are getting a standard article of known merit.

Weyerhaeuser Forest Products are distributed through the established trade channels by the Weyerhaeuser Sales Company, Spokane, Washington, with branch offices and representatives throughout the country.

Broadening Out

(Continued from page 330)

and although we had no idea that we would make Washington that night, we slept there just the same, but not without the usual amount of trouble afforded by a Lizzie. The paved highway referred to above is wonderful. It is called the Shenondoah Pike and it leads right through the heart of the valley by that name. I really began to think that I was getting near home again, the landscape surroundings and especially the farm buildings looked so much like those in the North.

It is really very picturesque. A range of mountains encloses the valley on either side, both plainly visible the entire stretch of the valley. In some places the valley seems to be but a few miles wide and again it widens out to a broad expanse of rich farming lands. The farmers here are evidently quite prosperous, judging from the farm buildings and appearances in general. I really believe that I could enjoy living down here.

About six o'clock that day we arrived at Hagerstown, Maryland, and after being routed out from one of the leading garages, we headed for Washington. We were thankful, indeed, for the paved highway on account of the hilliness of the country. We hadn't gone far when we discovered that the constant use of the brakes had burned out the brake linings, and there we were with night setting in and a lot of hilly country before us. We crept along as cautiously as we could until we reached a small town garage, where we were informed that nothing could be done for us that night. But the foreman of the garage told us not to let that stop us for he had driven the same road more than once without any brake linings by braking the car with the reverse and throwing the motor into low. And this we did, and thanks to good luck and Bob's careful driving, we arrived here at 11:30 that night. We passed through a place called Frederick and I felt certain that we were in the place that once harbored Whittier's Barbara Frietchie. Let's see, how does that go?

"Up from the meadows rich with corn,
Clear in the cool September morn,
The clustered spires of Frederick stand
Green walled by the hills of Maryland."

That's as far as I can go, but it makes me anxious to read that poem again. I was sorry that we did not see the town in daylight but it is quite possible that we will pass through it again on our way home. This is our second night here and we expect to start out early to-morrow morning on the last stretch. The car has been in the garage all day having some new brake linings put in. This put us to some inconvenience because we had to do the town on foot. We just got it out this afternoon about 5:30, after paying a bill of $13. Well, it had to be done no matter what the cost.

And now, since we have tickets for the show tonight, I must bring this letter to a close. Bob has been at me the last fifteen minutes trying to get me to stop and he has all but taken the paper I am writing on away from me. He gets so impatient when he wants to do a thing. This is the last letter that you can expect. I hope to be with you all by the end of next week if everything goes as we have planned. We will stop in Chicago a couple of days. I would rather come right on through, but Bob says he has to buy some clothes for school and several other things which he has failed to mention. Wish I could afford to have a new suit, too, but I guess I will have to practice Greene economy for another year. With much love to you all, I am

Your affectionate son,
JIMMY.

Junior Letters

Hoard's Dairyman Juniors:—My father takes Hoard's Dairyman and I read the Junior page every time the paper comes. I study how to raise and how to judge cattle. I raised a calf two years ago and it sure is a fine one. We had ten calves all at once that year and my father let me pick out the one I wanted. I judged my calf by what I had learned from the paper and books that I had read, and it is the best cow in the barn. I am 14 years old now and quite tall for my age.

Washington. Bernard G. Stensoa.

Hoard's Dairyman Juniors:—I am 10 years old and in the fourth grade. We live on an 80-acre farm and have 4 milk cows, 13 heifers, and a registered bull, all Jerseys. We have 4 horses and a Shetland pony and 11 Lincoln sheep. My pony's name is Dolly.

I have three sisters. Dorothy is eight years old and goes to school with me; she is in the third grade. Maxine is four years and Marjorie is two years. I have some pet rabbits and Dorothy has some pet Bantam chickens.

I wish some of the juniors would write to me. My address is R. R. 3, Palouse, Wash.

Harold C. Blood.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. I am thirteen years old and will go into high school to-morrow, as we have examinations twice a year.

I live on a 125-acre farm 4 miles south of Medina. We have a herd of registered Jersey cattle of the Owl Interest blood. The herd now numbers thirty. I own a pure-bred heifer nine months old which I think a great deal of.

We have ten pigs we are raising to sell for meat and two brood sows. One of the sows is a pure-bred Poland China.

We have a tractor, a truck, and a Ford car. We used the tractor for making hay last summer and I run it. We like the tractor very much. I can also run the truck and car. We keep only two horses and they are not busy much of the time.

We also have an electric light system and a water system. We would not do without them. We have them in both house and barn. We run the corn sheller and churn with electricity. We also have a milking machine which is a great help.

I have been trapping some this year and have caught 15 muskrats, 1 skunk, and 1 rabbit. I have not sold them yet.

I guess I have written enough this time and wish good luck to the juniors. I hope some of you will write to me. My address is R. F. D. No. 1, Chippewa Lake, Ohio.

Maynard Abbott.

Cedar Crest Farms

have never possessed a finer lot of BERKSHIRES than at present. Let us name you prices on fall and spring boars and young gilts.

J. K. Dering, Owner, Lake Villa, Ill.

Early to Market—Full Weight

51 per cent of all hogs marketed in the United States in 1918 were Duroc-Jerseys.

Duroc-Jersey hogs have proved themselves in championship shows as well as on the market.

Duroc-Jersey hogs raise large families and put on weight quickly. They are hardy, easy feeding animals that mature at an early age, and are uniformly red in color.

The National Duroc-Jersey Record Association. Dept. 300 Peoria, Ill.

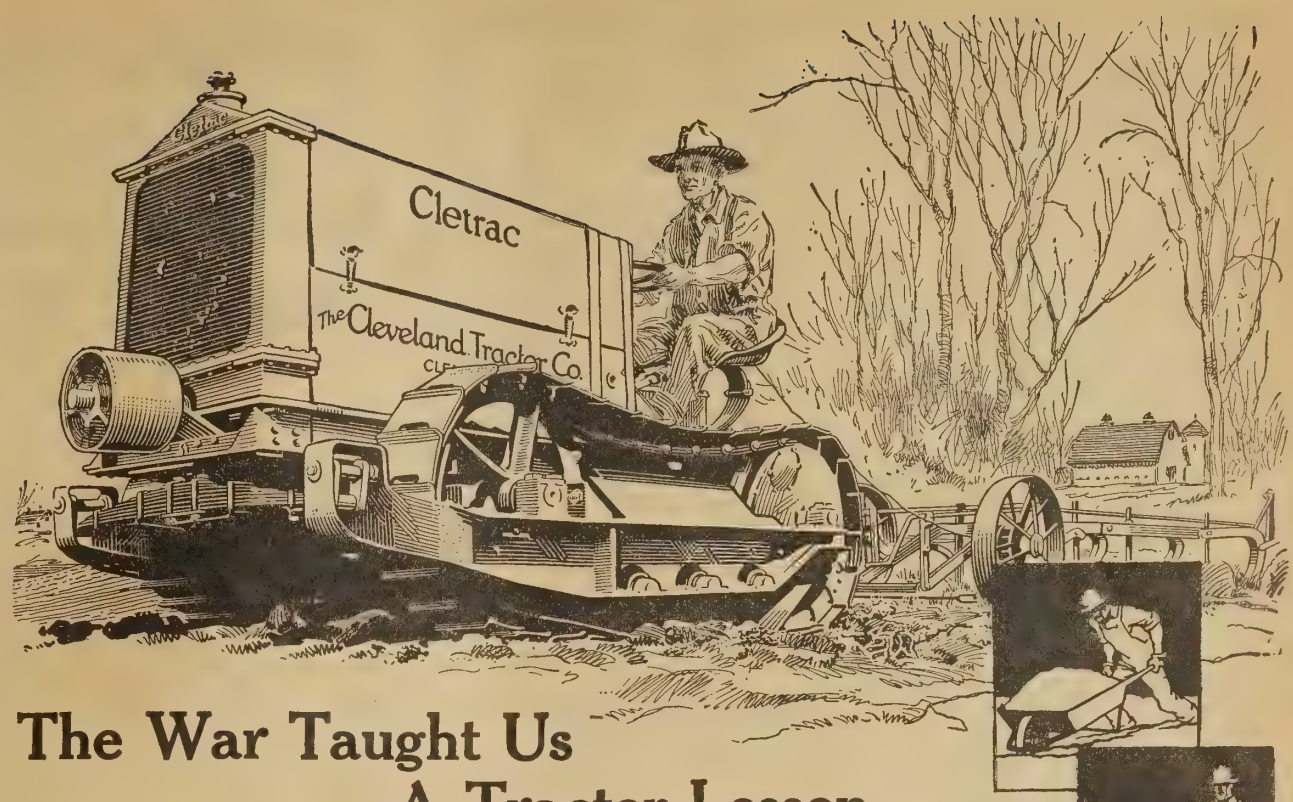
The largest swine record association in the world—12,000 members

Farmers' Week at Cornell

(Continued from page 308)

supplying milk primarily for city consumption. The state may put 47 per cent of its production into the city fluid markets, but League areas put 75 per cent or more there. The consumption in cities is not uniform for a variety of reasons, therefore it is necessary to maintain some surplus all the time. If the price of milk were put upon a butter basis farmers would change to summer dairying and omit the rigid sanitary restrictions of League milk. It is not logical that all milk should sell on a surplus basis. Clothing is sold on a cost plus basis, not on the price at which surplus is occasionally dumped onto the auction stores.

Previous speakers had made it appear that the League charged the dealers one price for milk and then went into competition, selling milk so low that it netted the farmers less than the milk sold to the dealers netted them. Mr. Miller branded this as untrue. Only a very small amount of milk is thus sold by the League, and that at a price that would net the farmers more than the dealers paid for milk bought of the League. The question of poor milk or good milk is not particularly encouraged by the co-operative plan further than to pay a higher price for A milk than for B just as at present, and less for C than for B.



A monopoly in the milk business, stated Mr. Miller, is an impossibility. If there should be six-dollar milk, as one speaker tried to contend, or even four-dollar milk, with 20 to 25 cents to the consumer, as he suggested, there would at once be a stampede in the fruit and vegetable growing sections towards dairying and the dairy sections could shortly double their output.

The milk companies, announced Mr. Miller, "admit" that they are efficient. At the same time the Federal Milk Commission stated that the system of distribution is crude, inefficient, and expensive, and Mr. Hoover at the Milk Show in 1918 made the same assertion. With farmers selling milk in February, 1921, at six cents a quart and consumers paying sixteen cents there would seem to be inefficiency or extravagance somewhere.

Cook Supports Co-operation

It was not so long, however, before H. E. Cook came on with his homely common sense and his jokes relating to dairying conditions. Co-operation is the big job now, announced Mr. Cook. I have known men to quote him in an attempt to down pooling in the League, but he stands solidly and emphatically for it. Every dairyman is for it if he knows his business, and the dealers should be. Let all get together and put the proposition through at the earliest possible moment. Another thought was that of keeping every cow and every acre hard at work for profit. Then keep your credit good at the bank.

Mr. H. E. Cook always captivates his audience whether they fully agree with him or not. He asserts that, generally speaking, the good dairyman is a poor farmer. Then he says that if we would quit producing milk on the grain grown in the West we wouldn't have milk enough to give us a chance to talk surplus. To take the place of western grain he would grow clover, perhaps a little alfalfa sometimes, would have an abundance of timothy, although it is not nearly so valuable as the same amount of clover, and good corn silage, not cornstalks for silage. His grain would be a mixture of barley and oats, and I strongly suspect he might continue to purchase a little cottonseed or oil meal or some high protein feed.

The War Taught Us A Tractor Lesson

WHEN power is needed over soft, wet or rough ground—on the battlefield or on the farm—only the tank-type tractor can "deliver the goods." The Allied Armies learned that lesson well in France and tens of thousands of farmers the world over have taken it to heart.

Take early spring plowing or discing. Cletrac's two broad tank-type tracks get a firm grip on footing where ordinary tractors would "mire in." Cletrac goes right ahead and gets the plowing or discing done and out of the way when the ground is almost too soft for horses.

The Cletrac farmer keeps ahead of the game right through the year. His fast-working Cletrac makes the most of every minute of good weather. He gets bigger and better crops at a lower cost per bushel.

You'll find it worth-while to read *"Selecting Your Tractor"*—that interesting booklet on power farming. Send for your free copy and see the Cletrac dealer near you.

SPECIFICATIONS

Horsepower: 12 at drawbar, 20 at belt pulley.
Length: 96 inches.
Width: 50 inches.
Height: 52 inches.
Weight: 3420 pounds.
Turning Circle: 12 feet.

WANTED
Registered Holstein Bull

Very highest grade, old enough for immediate service, delivered to Williams Bay, Wis. Kindly give full particulars, including markings.

S. T. COOPER,
Conway Bldg., Chicago.

WORLD'S RECORD STOCK

Two bull calves born November 19, 1920, sired by Carnation Denver Segis, an oustanding son of Matador Segis Walker, sire of three world's record daughters and half-brother to the world's record cow—Segis Pertiertje Prospect.

Fredmar Matador Colombo De Kol, evenly marked, out of Nezi Pontiac Rose Beets, a three-year-old on yearly test, milking over a ton a month and getting better each month. Price—$150.00.

Fredmar Matador Canary Paul, seven-eighths white, out of Francis Burke Homestead, a six-year-old on her first test, but milking over 2,100 lbs. a month, ranked 4th in over 300 Missouri Dairy Cows last month, this month she increased milk nearly 200 lbs. over last month and is getting better every day. Price—$200.00.

Both calves are sturdy, vigorous, healthy and will make splendid sires, growing in value every day on account wonderful records being made by Matador's sons and daughters.

Two Other Good Ones

Sir Fredmar Ormsby Rag Apple, born Oct. 21, 1920, sired by Sir Ormsby Akkrummer Hengerveld, grandson of the only 1,500-lb. cow. Dam, a show heifer of great size and splendid conformation, will be shown at State Fairs and National Show this year. She is on yearly test. This bull is a beauty, fit to show in any company. Price—$250.00.

Fredmar Calamo Hengerveld, son of the famous show bull, Joe Calamo Hengerveld, born Dec. 9, 1920, out of a two-year-old daughter of King Segis Pontiac, the famous bull with hundreds of famous sons and daughters. This heifer was first prize winner at New York and Ohio State Fairs in 1919 and her son will repeat as he is beautifully marked.
Will ship any of the above, carefully crated on receipt of check. Fuller details cheerfully furnished on request.

Bulls That Will Build The Future —In The Pabst Sale

PABST SALE
SURPLUS ANIMALS
APRIL 2d

Settle your herd sire problem at our second semi-annual sale at the farm April 2d. We will then sell 29 young bulls as good as we have ever raised, including fifteen sons of Creator and sixteen sons of yearly record dams. In our last sale 37 bulls all went to head different herds. Breeders appreciate the value of a Pabst Stock Farm bull at the head of their herd.

Look over this partial list, and send for sale list, which is now ready. It gives complete information on all of them.

1—PABST KORNDYKE CREATOR, a Creator son from a 25-lb. sister to a 35-lb. cow. This dam has produced a 29-lb. daughter and her own dam has 26 lbs.

2—PABST PONTIAC CREATOR, a Creator son from a 22-lb. junior 3-year-old daughter of King Pontiac Champion. Her dam is a half sister to a 39-lb. cow.

3—PABST CREATOR ACHILLES, a Creator son from a 29-lb. and yearly record daughter of King Pontiac Champion. Dam has 898 lbs. butter from over 20,000 lbs. milk. Her dam also has a yearly record of over 800 lbs. Third dam has a yearly record of almost 900 lbs. His five nearest dams average over 1,000 lbs. butter. A great bull.

4—PABST CREATOR MODEL, a Creater son from a sister to three cows with records of 1,000 to 1,200 lbs. in a year. Dam has 600 lbs. milk and 27 lbs. butter and also has a splendid ten-month record.

5—PABST CREATOR ELDER, a Creator son from a 29-lb. Champion dam. Her dam has 31 lbs. in 7 days and 1,050 lbs. in a year. A splendid calf.

6—PABST KING PONTIAC LAD 43D, a grandson of King Pontiac Champion and a 39-lb. cow. Dam is a sister to Pabst Korndyke Cornflower, a 38-lb. 3-year-old that sold for $30,000. Second dam is a 35-lb. daughter of Champion, third dam a 29-lb. 3-year-old.

7—PABST CREATOR DUKE, a Creator son from a junior 3-year-old with 21 lbs., she a full sister to a 29-lb. cow with almost 900 lbs. in a year. Second and third dams have 800 lbs. butter in a year and 27 lbs. in 7 days. His own dam is on yearly test and doing well.

8—PABST CREATOR CYNTHIA, a Creator son from a 23-lb. junior 4-year-old, her dam the highest record daughter of King Pontiac Champion with 38 lbs., third dam a 29-lb. cow. A calf of rare breeding.

9—BORN DECEMBER 16, 1920, a Creator son from Pabst Champion Dora Korndyke. This means the two grandams of this bull are Champion Dora Korndyke and Spring Brook Bess Burke 2d that together have seven 1,000-lb. yearly records. The dam has just made 21.88 lbs. butter as a 2-year-old and is on yearly test. This bull comes from one of the best combinations of breeding and high records in our herd. He is an exceptional calf.

10—PABST CREATOR IVY, a Creator son from a 34-lb. dam with a ten-month record of over 80 lbs. butter. She has produced a 32-lb. daughter and is a maternal sister to a 1,100-lb. cow with almost 26,000 lbs. milk.

11—BORN DECEMBER 25, 1920, a Creator son from Pabst Kinnickinnic with three records above 32 lbs., one above 35 lbs. A sure 1,000-lb. prospect. The two nearest dams of this calf now average over 1,100 lbs. with the dam's record at ten months.

Also Selling Fifteen Young Cows

There are some very good young cows in this offering, seven of them in calf to Creator. There are a number of daughters of King Pontiac Champion included. There is a granddaughter of a 33-lb. cow from a 29-lb. Champion dam, the next dam a 31-lb. cow with over 1,000 lbs. in a year. She is bred to Creator. Another is by King Pontiac Champion from a 24-lb. dam, third dam a 25-lb. cow, also in calf to Creator. A 23-lb. daughter of King Peter. A daughter of Champion from a 22-lb. dam. A full sister to a 26-lb. cow in calf to a son of Korndyke Segis Johanna. A daughter of Maplecrest King DeKol from a 30-lb. daughter of Champion. This cow now has a yearly record of 864 lbs. and is a large, handsome animal. In calf to a brother of Pabst Korndyke Cornflower. A daughter of Korndyke Segis Johanna from a 19-lb. cow, also in calf to Creator. A daughter of King Pontiac Champion from a 21-lb. daughter of King Ormsby. A daughter of Pabst Pontiac Hengerveld from a 26-lb. 4-year-old daughter of King Pontiac Champion. This heifer has a good record and is now making a good yearly record. She is also in calf to Creator.

New York Butter Market

NEW YORK CITY, MARCH 1:—Discouraged dairymen must view with considerable satisfaction the change in the general conditions of late affecting their industry. But three short weeks ago it seemed that the bottom had dropped out of the markets for all dairy products and that pre-war prices would be established before the beginning of the flush season of production. The fact that consumption has greatly increased of late is responsible to a great degree for the decided price advances of dairy products which have materialized recently. That applies not only to butter, but to cheese, condensed milk, etc. Because of the awakened activity in the condensed milk industry, which is responsible for the re-opening of many of the factories that were closed, less milk is being converted into butter and cheese which is causing a curtailment of production of those products. In consequence, receipts of butter and cheese in the large markets are comparatively light, while demand is heavy, the result being sharp advances in the prices of those commodities. The recent developments convince handlers of dairy products that there will be greater activity in those commodities this summer than was anticipated earlier and that values will be higher than thought possible during January and February.

At the present time, there seems to be an inclination on part of butter receivers to purchase less Danish butter. During the past week, only 1,400 casks of that butter have been unloaded in this port. It is reported that a vessel left Copenhagen on February 25 carrying a cargo of about 11,200 casks of Danish butter which will arrive here about March 10. It is thought that no other Danish butter will arrive before that time. Receivers who purchased the butter which arrived recently from Denmark are realizing large profits at present as the butter cost them about 42c per pound, duty and transportation paid, and they are now selling it at prices of 53@54½c. However, on earlier shipments great losses were experienced as a result of the slump in prices during January and the first half of February. Receivers now feel that prices can go but little higher and that declines must materialize during the early spring months, hence they hesitate to contract for shipments, which will not arrive for several weeks, at prices which prevail today.

A very noticeable feature of the market at the present time is the less critical attitude of butter buyers. For several months, the demand has been for nothing but butter of extremely high quality. As a result, there has been an accumulation, at times, of millions of pounds of highly edible butter, but which could not be classed as fancy, because of the critical attitude of buyers. Butter is now so scarce that good firsts are moving at prices very close to the quotation on extras. Minor considerations, such as slight variations in color, quantity of salt, etc., are now given but little thought. Practically all the fresh butter that is received is moved as quickly as it is delivered to the receiver's store. There is also a strong movement of storage butter, the warehouse holdings in this city being now but 6½ million pounds. Accumulated supplies of Argentine and other foreign butter are also clearing up well and at satisfactory prices.

During the past week, the price tendency has been decidedly upward. That has been due entirely to the stimulated demand and to the fact that current arrivals have been small. The past week opened with the quotation on extras at 49c. That quotation remained unchanged on Monday and Wednesday, Tuesday being a holiday, but on Thursday the price advanced 1c. That was followed by successive advances of 1½c on Friday, 1c on Saturday, 1c on Monday of this week, and 1c today. The feeling now obtains quite generally that the top has been reached and that declines may be expected soon. Established quotations today are: Extras, 54½c; higher scoring than extras 55@55½c; firsts (90-91 score), 52@54c; firsts (88-89 score), 49@51c; and seconds, 39@47c.

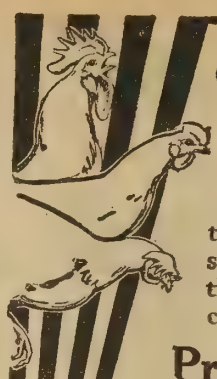
W. B. LIVERANCE.

Michigan Dairy Interests Convention

The annual convention of the Michigan Allied Dairy Association held in Grand Rapids, February 15, 16, and 17, embracing all phases of the dairy industry in Michigan, was voted a success, although the attendance was not quite up to expectations.

The annual address of the president of the Association, Glen Overton, was received with keen interest.

All of the old directors were elected to succeed themselves as follows: Glen Overton, representing the butter interests; N. P. Hull, representing the interests of the producers; C. H. Parker, representing the market milk distributors; E. G. Pray, representing the condensed milk and milk powder manufacturers; N. J. Dessert, representing the ice cream manufacturers; and R. A. Page, representing the cheese manufacturers. Two new units were initiated into the organization: The Dairy Department of the Michigan Farm Bureau and the Dairy Equipment and Supplymen's Association of Michigan. M. L. Noon was elected to represent the former, and R. J. Ellwanger, the latter.



Mr. N. P. Hull acted as toastmaster at the banquet. Among those responding were Professor A. C. Anderson, Professor O. T. Goodwin, Michigan Agricultural College; Ed. K. Slater of the Olsen Dairy Publication; James Nicol, president of the Michigan State Farm Bureau; W. A. McDonald of the Connor Ice Cream Company; John W. Ladd of the John W. Ladd Company; Judge White of Chicago; and Dr. C. W. Larson, Washington, D. C.

The impression that prevailed on every hand was that the association has successfully weathered the first year of its existence, it is well out of its swaddling clothes, and is destined to become a potent factor in the development of the dairy industry in Michigan. The association has actively co-operating with it the dairy division of the State Farm Bureau, the Food and Drug Department, and the Dairy Department and Extension Division of the Michigan Agricultural College.

The educational exhibit under the auspices of the Michigan Agricultural College received much favorable comment as did the "Dairy Bar". "Give me a milk blossom". "Pass out two milk juleps, and make it snappy". "A buttermilk lemonade for mine, and don't strain your arm hoisting it". These and similar words of encouragement to the "bartender" floated out from the hotel bar room Tuesday, where in days of old the calls were for a "horse's" neck", a short beer, and other pre-Volstead beverages. The milk bar was doing business at the old stand.

Michigan. W. D. WENDT.

It will pay to feed the family as carefully as the pigs or the dairy cow. If there's something to balanced rations for live stock, it stands to reason "just food" isn't enough for the family.

Better Home Heating at Less Cost

There is no reason why your house should not be as warm and comfortable as hundreds of others. Their owners have found that with less fuel than their stoves were burning, they could keep every room at a uniform temperature.

Now, instead of over-heated sitting or dining rooms and cold bedrooms and halls, all doors can be left open and in every room there is pl asant warmth.

You, too, can change to such warm comfort in a day and save many dollars yearly on your coal bill. A New Idea Pipeless Furnace will do this for you. Our money-back written guarantee protects you absolutely. A New Idea costs litte more than a good stove, for lower prices again prevail.

Ask the New Idea dealer near you to explain the many advantages of the New Idea Furnace. If you don't know him, write us, and we will send his name. Expert heating advice free to you.

Advantages of the New Idea

Frameless Feed Door Cup-Joint Construction.

When Writing to Advertisers, Mention Hoard's Dairyman

A Cow, a Sow, and Some Hens

"The war is on; the world needs cotton; prices are good; so we should worry about other crops,"—that was 1918 and 1919. How about the present? Last year many farmers in Oklahoma planted practically all of their tillable land in cotton and actually ridiculed the slow, hard working live stock farmer. We only need to read the market reports to see what happened to both class of farmers. Cotton prices slumped to such a low level that it hardly paid to gather the cotton and today there are thousands of acres of cotton that have not been gathered and will not be. The cotton farmer took a gambler's chance to either make or break. He broke!

The live stock farmer is doing well even though prices of all farm products have dropped. He can still market his corn, hay, etc., through his cows, hogs, and chickens, and make a profit. His grocery bill is much smaller as he has dairy products, pork, and poultry products a plenty for his own family and on top of all this his cows are giving him a monthly cream check that makes the banker say "Good morning" to him a little more cheerfully than he does the cotton farmer.

Realizing that these conditions existed along their lines in Southwestern Oklahoma, the Rock Island Railroad took steps toward bettering agricultural conditions in that section. Through their agricultural commissioner, Alexander Jackson, they arranged a campaign on dairy cattle, hogs, and poultry—the slogan of the campaign being "A cow, a sow, and some hens on every farm".

Mr. Jackson is very successful in advertising in a way that gets the farmers out. The Oklahoma Agricultural College co-operated with the railroad company by contributing the following speakers for the entire week: C. W. Radway, dairy specialist; R. W. Clark, swine specialist; and C. M. Smith, poultry specialist. Meetings were held at Carnegie, Mountain View, Gatebo, Hobert, Lone Wolf, Granite, and Mangum. Mr. Joel G. Winkjer of the U. S. Department of Agriculture, Dairy Division, and F. W. Atkeson, representing the American Jersey Cattle Club, were present and spoke at all of the meetings except the latter part of the week.

The message of better live stock was carried to about 1,800 people through this campaign and much interest was shown. There is some dairying in progress now and with further development it ought to help the Jersey business as the prevailing sympathy is with the Jersey and nearly all the grades of dairy type are Jerseys. Arrangements have been made with the county agent of Kiowa County for a pure-bred Jersey calf club early in March.

Missouri. F. W. ATKESON.

Milk Campaign Work in Kansas

(Continued from page 307)

tain school districts in Topeka it was found that about one-third of the children were using no milk at all. A milk demonstration was placed in the State Street school for a period of five weeks only, but there was an average gain of 1 lb. per child during this time where 6 to 8 oz. is normal gain for that length of time. It was also noted that the children who are most underweight make the most rapid gains. The milkman in this district of Topeka reported a 100% increase in milk sales in this vicinity, due very largely to this milk demonstration at school.

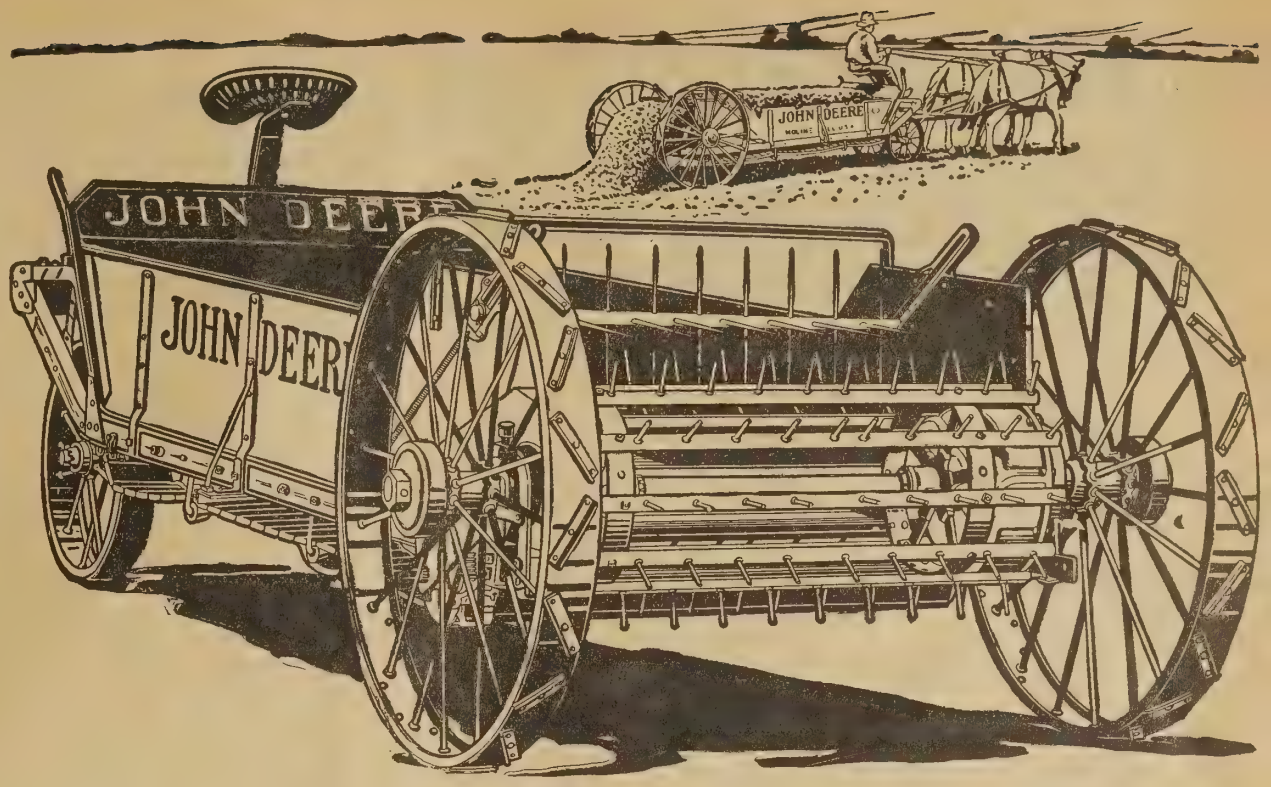
The dairymen of Topeka reported a 25% increase in milk sales immediately following the city milk campaign in Topeka. The Beatrice Creamery of Topeka reported a 30% increase in butter sales compared with the same month of last year. Soda fountains have also reported 10 to 15% increase sales in milk drinks as a result of milk campaigns.

Small Towns Have Largest Number of Underweight Children

Surveys in rural districts have shown many interesting facts. In Shawnee County thirty school districts reported 689 children in all. Twenty-two per cent of the children were 10% or more below standard weight; 42% drank milk regularly; 21% drank coffee regularly.

Less than half the rural children are regular users of milk.

In Labette County a total of 543 children were weighed and measured. Out of this number 122 children were 10% or more below standard weight, or 22% of the whole. In connection with this survey it was found that the largest number of underweight children were in the small towns. In the small town of Mound Valley there were 161 children in the grades; 51 (32%) of the children were 10% or more underweight. In Altamont, another small town, 109 children in the grades; 27 (25%) of the children were 10% or more underweight. In Preston, another small town, 177 children examined, 74 (43%) were 10% or more underweight.



This fact can be attributed almost wholly to the fact that milk is not as plentiful as it should be around these places and many families are entirely dependent for their supply of milk on the neighbor's cow.

Essay and Poster Contests

In the state-wide campaign a milk essay contest was planned for the rural and small town schools in every county in Kansas. In farm bureau counties the local contest was under the direct supervision of the county agent or the home demonstration agent co-operating with their county superintendent. First, second, and third prizes were offered, which varied from $15, $10, and $5 to $3, $2, and $1. In non-farm bureau counties the essay contest was in charge of the Milk Utilization Specialist co-operating with the respective county superintendents. Cash prizes of $4.00, $2.50, and $1.00 were offered as county prizes in the non-farm bureau counties. The first prize essay in each county was entered in an All-State Contest where the prizes were $25, $15, and $10. Over 100,000 milk leaflets were distributed through the rural schools of Kansas and many interesting and instructive essays were the result. The children in forty-three counties in Kansas took an active part in this contest.

A milk poster contest was also opened to the art departments of the Kansas schools and many good posters were received. Out of this Kansas will probably have a milk poster of her own for future use. The newspapers of Kansas co-operated in a most satisfactory manner in publishing milk stories for Milk Week, which was October 11-16. The home economics teachers of Kansas co-operated by teaching milk lessons during that week. School superintendents and principals co-operated by giving milk talks to the school cihldren. As a result of this campaign many children are using more milk and many of them are carrying milk to school with their lunch. This was quite an unheard of event a year ago.

Of course the pure-bred sire is the first step, but there's no good argument against pure-bred females in live stock improvement.

The Simplest Manure Spreader Built

TAKE off the ordinary spreader about half the parts—all clutches, all chains and numerous castings. Only then will you begin to approach the simplicity of the John Deere Spreader. The John Deere has no chains to break, no clutches to wear and slip, no extra beaters to complicate it. So unusual is its design that practically you will have no adjustments to make.

This extreme simplicity, resulting in extra years of profitable service with minimum loss of time and repair expense, has been made possible only by mounting the beater of the John Deere Spreader on its axle—a patented feature.

Additional results from this special patented beater construction are:—

1. A spreader that is exceptionally easy to load. An average of only 36 inches from ground to the top of the box—about hip-high. The high lifting of manure—the hard part of loading—is done away with.

2. High drive wheels that furnish extra traction and lighten the draft. Remember, the drive wheels on the John Deere have not been cut down to lower the box.

3. All of the main working parts mounted on the axle—they can't get out of line to cause binding, heavy draft and breakage.

Another important feature is the patented revolving rake. Embedding itself into the manure and revolving as the load moves towards the beater, this rake prevents bunching and greatly assists in securing a fine, even spread without adding one extra pound to the draft.

You can get a straw spreading attachment for the John Deere Spreader that spreads all kinds of straw perfectly. This attachment makes a two-in-one machine at little more cost than for the spreader alone.

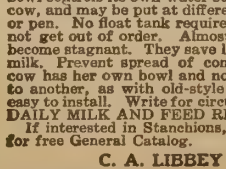
Don't forget there is no fertilizer so effective as barnyard manure. You can double its value by spreading it with a John Deere Spreader.

See your John Deere dealer. Put this profit maker to work this spring.

This Big Implement Book and Two Others —Free

"Better Farm Implements" contains 114 pages of valuable information on a full line of labor-saving farm implements. A book you will keep.

"Soil Fertilizers" tells all about barnyard manure, how to preserve it, when and how to use it. Written by an agricultural authority.



John Deere Spreader booklet fully illustrates and describes the best implement investment you can make.

To get these books free, drop a line to John Deere, Moline, Ill., and ask for Package S 614.

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.
15% More Milk
Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.
Libbey Automatic Water Bowls
are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.
If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

POSITIONS WANTED

Position Wanted—Married man, experienced dairy farmer, semi-official testing, crops, machinery. Good habits, capable of taking charge. Would consider position calf raiser on large breeding farm. Wife willing to board two or three men. Minnesota, Iowa or Wisconsin. State full particulars and salary. Address BOX 680, care Hoard's Dairyman. 8-2

Dependable, experienced, married man wants to operate dairy farming business selling clean milk, no boarding. Describe farm, cows, equipment, location, condition of business, dwelling and surroundings. CLARENCE DORSEY, Moro, Illinois.

Position Wanted—Single man many years in charge of dairy herds as milker, feeder and calf raiser. State your best proposition for attention, salary, board and room. M. L. RILEY, Barrington, Illinois.

Two young men familiar with tractors, general farming and dairying desire position on modern farm, or neighboring farms in United States or Canada. References. DARRELL JONES, Chambers Prairie, Wash.

Experienced tractor operator wants job driving tractor. Ohio, Pennsylvania or New York. HOWARD CLOSE, 65 Groton Ave., Cortland, N. Y.

City Luxuries are Farm Necessities

In the course of one of his public addresses, Mr. J. R. Howard, President of the American Farm Bureau, spoke in part, as follows:

"The farm home today is the heart of this country, and we should endeavor by every reasonable means to make those farm homes better. There should be in every farm home of this country the same comfort that there is in the city home.

"I am going to tell you a little personal experience. Four years ago when the war was on we were like everyone else—hard pressed for help. During the winter an electric light plant man came out and wanted to sell us a lighting plant, and we told him we could not buy for we would have to borrow the money.

"When spring came we were putting in the crop, and Mrs. Howard said to me one day, 'I am at the end of my ability to do this work. You will have to rent out some of the ground. I can't cook and wash and keep house for the farm help and all of these hired hands.' We could not get any help in the house. We could not get the washing done except we took it twenty miles and went twenty miles after it, which was an impossibility. And we reverted to the talk of that light plant. She said, 'If I had some way to get the ironing done and did not have to take care of these old lamps, and if I had a vacuum cleaner and a fan to take some of the heat out of the kitchen, I think I could get along.' I replied, 'You know why I did not buy that plant,' and she said, 'I know, and we would have to borrow the money, but I believe if that fellow could put in a plant right away I would try to borrow the money.'

"The next day I was out plowing with a tractor, and a fellow jumped across the fence. I don't know how he ever knew what we talked about at home, but it was the electric light plant man. I asked him if he could put it in right away. 'Yes, I can put it in next week.' So I told him to write out the order right away and he did, and we put it in.

"Do you know how I paid for that plant? I borrowed the money for 90 days at 7 per cent and I knew I could not pay it. I renewed that note four times before I paid any of it, but do you know what that plant did for that country home of ours? It saved the day for us. It made housework easier. The housewife could go ahead and enjoy as necessities those things which her sister in the city had as luxuries. It increased our production on that farm.

"When at the beginning of this school year we took our family to the city in order that I could be at home occasionally while I was doing this farm bureau work, we did it with a good deal of fear and trembling for fear our boys would be obsessed with the lights of the city, but the boys were too wise to be fooled. That electric light plant, and other things comparable to it, had made the old farm life so enjoyable to our family that, though now in Chicago, the boys do not talk about anything but going back to the farm as soon as school is out in June.

"Now, we have to have those things on our farms. The things which the city people have as luxuries are necessities in the farm homes of this country. We have a credit which will enable us to have those things on our farms. We have to have rural schools, my friends, that are just as good as any schools in the city. Do not forget that. Don't forget that the rural school and the rural church are cornerstones of American civilization. And when we get those things, farm life will be better and we will have a new day in agriculture."

Ayrshire Quarterly a Monthly

Annual Meeting of Association to Be Held at Milwaukee

At a recent meeting of the Executive Committee of the Ayrshire Breeders' Association, it was decided to change the breed's publication from The Ayrshire Quarterly, published four times a year, to The Ayrshire Digest, which will appear each month. J. G. Watson is editor; Clyde N. Smith, associate editor; and Arthur H. Sagendorph, business manager.

At this meeting it was recommended by the Executive Committee that the Board of Directors call the annual meeting for 1921 at Milwaukee, Wis., in June, and that the national sale be held at that place. The secretary was instructed by the Executive Committee to write all fair associations, state bureaus of animal industry, and the Bureau of Animal Industry at Washington requesting that the owners of all animals entered for show purposes furnish federal or state approved test charts before being admitted to their respective fairs and that all charts be approved by a federally accredited veterinarian.

Cheese Prices for February

The daily quotations of the U. S. Bureau of Markets show the following average prices for American cheese (style Twins) for three large markets in February, 1921 and 1920:

	Average price Feb. 1921	Feb. 1920
	Cents	Cents
Wisconsin Boards	25.10	27.82
Chicago	24.91	29.30
New York	27.00	30.16

Longhorns averaged 26.16 cents on the Wisconsin Boards or one cent above the price on Twins. In February a year ago, they sold for 32.04 cents.

One of the secrets of success in spraying is doing it at just the right time. Are your materials and machinery ready?

If a thing is worth owning it's worth insuring, say the insurance men. And if seed is worth planting it's worth testing.

MARKETS

CHICAGO, March 3—Butter—Creamery, extras, 52c; standards, 51c; dairy, firsts, 44@50c; seconds, 30@38c.

Cheese—Twins, 25½c; Young Americas, 25½c.

MILWAUKEE, Wis., March 3—Butter—Creamery, tubs, 53c; prints, 54c; extra firsts, 50@51c; firsts, 44@45c.

Eggs—Current receipts, country candled, cases returned, 29@30c; seconds, 26@27c; checks, 25@26c.

Cheese—Twins, 26@26½c; Daisies, 26½@27c; Young Americas, 26@26½c; Longhorns, 26½@27c; fancy Brick, 22½@23c; Limburger, 1 lb., 22c; 2 lbs., 23c; Swiss Loaf, 40@45c.

NEW YORK, March 3—Cheese—Firm; state milk, common to specials, 12@29c; skims, common to specials, 5@19½c.

Butter—Firm; receipts, 8,701 pkgs.; creamery, extras, 54½c; state dairy, tubs, 29@54c.

17,602 Pounds Milk; 850.5 lbs. butter fat in a year is the record of this splendid AYRSHIRE. Healthy? Of course!

NOTE:—The trademark name has been changed from KOW-KURE to KOW-KARE—a name more expressive of both the PREVENTIVE and CURATIVE qualities of the remedy There is not the slightest change in formula or manufacture.

You, too, can have record cows

Even though you may not have a single cow in your dairy that can ever hope to approach the mark of a champion, there are nevertheless many opportunities in almost every dairy for greatly increased milk production.

How? Simply by keeping an accurate record of every cow—and working to make each cow BEAT HER OWN RECORD. Milk records are great indicators of the ups and downs of a cow's physical condition. If the milk-making organs become sluggish, you'll soon learn—as others have—that a little prompt attention to health will return dollars for every penny spent.

For toning up and warding off the diseases that attack the organs of production, nothing has yet been found so promptly effective as the Kow-Kare treatment. At slight expense you can insure your cows against disease by its moderate use.

The medicinal properties of Kow-Kare act directly on the digestive and genital organs, making them function normally. Barrenness, Abortion, Retained Afterbirth, Scouring, Lost Appetite, Bunches can be prevented—or successfully treated—by following the simple Kow-Kare home treatment.

Convince yourself by testing Kow-Kare on one cow. Your feed dealer, general store or druggist sells it in 70c and $1.40 packages.

FREE—Our useful book on cow disorders, "The Home Cow Doctor." Write

DAIRY ASSOCIATION COMPANY, Lyndonville, Vt.

"You may be Sure"

says the Good Judge

That you are getting full value for your money when you use this class of tobacco.

The good, rich, real tobacco taste lasts so long, you don't need a fresh chew nearly as often—nor do you need so big a chew as you did with the ordinary kind.

Any man who has used the Real Tobacco Chew will tell you that.

Put up in two styles

W-B CUT is a long fine-cut tobacco
RIGHT CUT is a short-cut tobacco

Weyman-Bruton Company, 107 Broadway, New York City.

The 20th Amendment

(Continued from page 305)

oleo do you sell in proportion to the amount of butter?" he was asked.

"One-third," was the prompt reply. The next storekeeper in this same town who was quizzed regarding the burning subject allowed that he sold from one-third to one-fourth as much oleo as butter in this hotbed of dairying interests. But a butcher around the corner volunteered that he, too, was in the good game, that he sold no butter whatever over the counter, contenting himself with disposing of seven thousand, five hundred pounds, taken from actual figures, of butter substitute, or one-fourth the entire amount sold in that dairying village of seven hundred souls.

Again—7,500 lbs. of oleo oils and vegetable fats sold by one butcher in one year in one village of 700 in one county in one state which prides itself on its mighty dairy interests! Not to speak of 30,000 lbs. sold in one year altogether in this same tiny dairying stronghold! Fifteen tons of oleo—and the store people volunteered the information that of this amount the dairymen themselves bought seven and one-half tons annually.

When you multiply seven and one-half tons of oleo, the amount used in one little town in New York State by farmers only, by the thousand and hundreds of thousands of towns throughout this country and Canada, not including the huge cities, one can begin to get the glimmering of an idea of what butter has been, is, and will continue to be up against so long as conditions remain largely as they are. There have been numerous remedies suggested from the standpoint of the milk producer, but the one the least advanced and least acted upon, apparently, consists of picking the beam out of our very own eyes before we attempt to drive the consumer into washing the moat from his.

But this is no laughing matter, this farmers-eat-oleo crisis. Things are going from bad to worse so far as milk consumption is concerned, and the empty pockets and jobless heads of city families promise no immediate return to recent times when conditions were reversed and every back stoop boasted one or two quart milk bottles just because money was flush and you had to spend it somehow. Europe no longer cries for our milk, though her starving children cry to her in vain for it, and on every hand we are hearing repeated that old bogy-tale, "Surplus!"

We can advertise and in a great measure take care of this surplus, as most people know. But we cannot do it consistently when the pikers and ignoramuses among us insist on betraying the industry they have embraced by a silver quarter in coin of the realm instead of a kiss, as did one Judas Iscariot. Their parsimony reminds one of the dog or fox or wolf in the myth who, in crossing a stream on a narrow bridge, looked down into the water and there beheld another like himself who also was carrying a bone in his mouth. To be sure, the dog or whatever animal he was had a bone of his own, but he wanted to get that belonging to the dog in the water too. So he snapped at the bone in the water, only to have his bone slip from his jaws, while he himself fell into the stream after the shadow.

Some day a lot of dairymen are going to fall into the stream of very hard luck if they continue to demand two bones in the shape of good prices for their own milk while they eat imitation butter at half the price of what they demand for themselves. Some day everyone will use oleo at the rate it is advancing in popular diet—and then, goodby, poor old butterfat, you have had your day!

There are a good many million dairymen left in this free country who are still able to look ahead a bit and figure out the results to themselves, from purely personal motives, if they attempt from now on to eat their oleo and have their butter sold too. Perhaps it is one of these who would like to add one more law to the constitution, to-wit, that the 20th amendment take care of those who would sell out the whole industry for a mess of pottage.

Elsie Stevens of Ohio is shown here holding the Holstein cow, Ferndale Nudine Blanche, which she milked four times a day during a recent 7-day test when the record of 475.9 lbs. milk, 14.56 lbs. fat was made.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Acute Mammitis

By this term is meant severe or aggravated and often ruinous inflammation involving the milk-secreting gland tissue of the udder. If simple mammitis be likened to cold in the head and bronchitis, acute mammitis corresponds to pneumonia. It is that form of inflammation which commonly spoils one or more quarters of the udder and tends eventually to involve and ruin the entire vessel. As a rule, it attacks but one cow and so is termed a "sporadic" disease.

It may be recognized by the severity of its attacks, by the high fever it causes, and the fact that the cow loses appetite, shows distress and pain which may end in weakness and emaciation. The attack is ushered in by a chill followed by a high fever and fast pulse. The quarter affected becomes intensely swollen, hard, red, and painful, causing lameness and straddling gait. The milk at once turns to whey containing curds and flakes and is sometimes stained with blood. Soon pus clouds the fluid and should the disease not subside it eventually loses all likeness to milk and becomes muco-purulent, brownish in color, and often foul smelling. In many cases hard tumors form in the udder replacing true gland tissue, and in some abscesses form and discharge pus into the milk ducts or externally. The milk from the other teats is unfit for any purpose at time of attack and when the cow recovers from the severe symptoms and remains a "three-teater" her milk scarcely can be considered fit for use. Such a cow is a menace if left in the herd as infection readily may be spread from her to other cows by the milkers' hands or by contact with floors, ground, or feed contaminated with the unsound milk or discharge from the diseased quarter.

Other causes of this disease are invasion of the udder by pus germs (streptococci) from the blood stream or lymphatics, or they may enter by way of a wound or abrasion or severe bruise of the udder or be carried by a milking tube, dilator, or bistoury (teat slitter) which has not been cleansed and disinfected by boiling for 20 minutes each time before use. Discharges from the vagina of a cow that has aborted, or expelled a dead and decomposed calf, or retained her afterbirth and become affected with pyometra getting onto her teats may also cause the infection. There can also be little question that germs are always more or less prevalent in the udder and may therefore cause this form of mammitis as a sequel to an attack of the simpler form of inflammation.

An affected cow should be isolated at once and the stall she has occupied at once cleansed, disinfected, and whitewashed. The milk, or abnormal fluid from her udder should be caught in a pail containing a disinfecting solution and then disposed of in such a way that it cannot cause infection. The veterinarian should give the cow hypodermic injections of mastitis bacterin and may consider it advisable to irrigate the udder with a mild milk-warm solution of boric acid or salt. Other treatment consists in frequent stripping of the udder, massages, and rubbing with camphophenique or a mixture of equal parts of carbolized oil, camphorated oil, and compound soap liniment. Iodin ointment and mercurial ointments may have to be used later. Despite all that can be done, however, perfect recovery from such an attack is extremely rare.

Ringworm

I have a herd of cattle which are affected with the so-called mange. These cattle do a great deal of rubbing and sores form around the eyes and about the neck and shoulders. Please advise remedy.

Hatchville, Mass. H. W.

The disease apparently is ringworm which is caused by a vegetable parasite and is contagious. Isolate affected animals and cleanse, disinfect, and whitewash the stable and fixtures, after removing loose trash. Treat by scrubbing spots free from crusts or scabs, if necessary first saturating them with sweet oil daily until softened. Then paint spots on face twice daily with tincture of iodin and rub iodoform powder into spots of upper eyelids. Saturate spots on neck and body with a solution of 4 ounces of sulphate of copper (bluestone) and 1 pint of hot water, and repeat the application every 6 or 7 days.

Indigestion

Advise me what seems to be the trouble with my calves from six weeks to three months of age. They bite on wood quite often. I feed them silage, ground oats, and skimmilk twice a day and clover hay all they will eat. Otherwise they are in good condition.

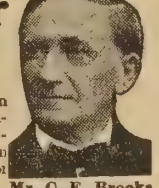
Turtle Lake, Wis. M. L.

Indigestion often is indicated by such depraved appetite or pica. Give each affected calf a dose of castor oil in milk. Stop feeding ground oats and allow the calves to help themselves to whole oats, wheat bran, and oil meal. Stop the silage. Allow free access to rock salt. Continue the milk, feeding it blood warm. Should the trouble persist, mix an ounce of lime water in each pint of milk fed daily.

A woodlot should be treated as the principal in a savings bank. The annual growth of wood corresponds to compound interest. When you cut out more than the equivalent of the growth, you are drawing upon your principal.

How Mr. Baldic Won the Sweepstakes

"I was awarded the sweepstakes at the Central Maine Fair at Waterville this year. I also got 40 ribbons, mostly blue, and received the highest praise from everybody for the quality and appearance of my products. I give a great deal of credit to Agricultural Gypsum for these excellent results. I shall use Gypsum on my entire farm next year."



C. E. Baldic

The experience of Mr. Baldic is a typical example of the gratifying results obtained by the systematic use of Agricultural Gypsum. You can accomplish similar results yourself. Not only does Agricultural Gypsum supply the soil with available sulphate sulphur; it is the cheapest form of nitrogen producer. It is also worth many times its cost as a preserver of nitrogen in manure; you need use only two to four pounds an animal a day. Send for our free illustrated book, which tells how and why. It will be mailed promptly, postpaid.

Shipping Gift Corn

Carl S. Vrooman, former Assistant Secretary of Agriculture and now Director of the the Farm Bureau Federation's Gift Corn Relief, is asking farmers to give 3 per cent of one-half of their entire corn crop for the relief of the starving peoples of the world. At the present time, Mr. Vrooman is only interested in securing corn but it is suggested that after the corn project is fully under way that some other sort of relief, such as canned milk, will be taken up.

The details for handling the 50 million bushels of corn it is expected to send in relief, have been well worked out by the men in charge. Farmers will haul their gift corn to their local elevators where it will be shelled and loaded into cars. In nearly all cases, this will be done free of charge as will also the freight and labor of getting this corn to the seaport. County agents will arrange all details for transportation in the counties under the direction from the state farm bureau. Loaded cars will be routed direct to the nearest of several designated mills, which will grind the corn into meal and other products.

The function of the American Farm Bureau Federation in the project consists in securing the corn from the farmers, loading the cars and routing them to the nearest mills. From that point, the project is under the responsibility of the Hoover Relief Committee and of the Polish, Near-East, and Chinese Relief Committees. Provisions have been made to insure that the corn reaches the famine sufferers at no cost to them. Reports will be rendered back to the donors as to the disposition of their gift.

AYRSHIRES

Linndale Farm Ayrshires

"Are bred for Production"

Bull calves out of A. R. cows and sired by sons of World Record cows, for sale.

Our { Breeding / Conformation / and Prices } are right.

Middlesex Meadows Ayrshires

We owned *CAVALIER'S NETHERHALL CHANCELLOR* who sired the winning bull calf at this year's National Dairy Show. We have two young bulls ready for service by this sire and out of cows with official A. R. records of better than 12,000 lbs. of milk and 450 lbs. butterfat. Both these youngsters have excellent conformation but we must have room and the first check for $400 takes either one. We have also some younger calves by this bull out of A. R. cows at $250 and up.

A. Henry Higginson

South Lincoln, Mass.

Monstone Farm Ayrshires

"Production — Size — Individuality"

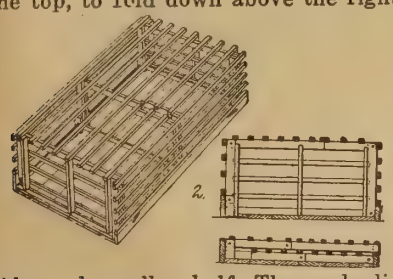
Inventions and Appliances of Interest to Agriculture

Collapsible Crate

To knock down this crate, the operator first holds each side down against the tension of a spring, then turns the ends horizontally on toggle links (see lower figure), and finally presses

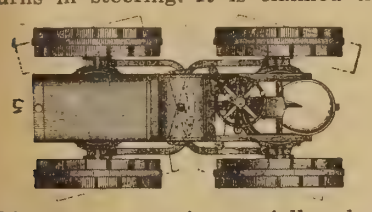


the top down and hooks it to the bottom.

(John T. Hendrick, Ready, Ky. U. S. Patent, 1,287,307.)

Knockdown Crate

The bottom sideboard at the left of this crate is higher than the one on the right. This arrangement permits the left side, and larger half of the top, to fold down above the right

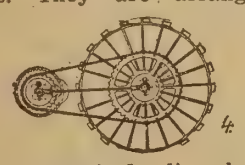


side and smaller half. The ends lie on the bottom under these.

(C. L. Austin, Sullivan, Ind. U. S. Patent, 1,335,635.)

Tractor

Each of the four wheels of this tractor are drive wheels, and each turns in steering. It is claimed that

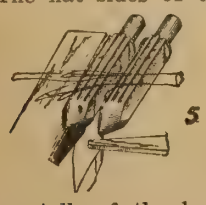


this arrangement is especially advantageous in orchards and vineyards where short turns are made at the ends of the rows.

(Lisenby Mfg. Co., Fresno, Cal. U. S. Patent, 1,343,979.)

Tractor

The new feature of this tractor is that the sprockets can be interchanged by removing the cotter pins and caps. They are arranged as



shown for power in hauling, but are interchanged for speed.

(Nash Tractor Co., Denver, Col. U. S. Patent, 1,325,853.)

Corn Husker

The snapping rolls here squeeze the ear out of the husk without injury to the ear and without shredding the husk. The flat sides of the rolls ad-

mit the stalk of the husk, and the grooved sides separate the ear.

(Burkett Mfg. Co., Columbus, Ohio. U. S. Patent, 1,329,752.)

Canada. C. J. LYNDE.

642 Pounds Fat

is the average on the A. R. daughters of Bellfounder, the sire of Countess Prue, the World's Champion Guernsey and My Fancy, eighth in Class A.

We offer bull calves carrying 15%—50% of this consistently high producing blood.

Prices $225.00 to $600.00.

The demand is keen; write today.

CONTENT'S MERRY BOY OF PROSPECT 64022

Dropped Dec. 23, 1919

The above picture very poorly represents Merry Boy. He is a regular bull calf—full of life and vigor. His conformation is the kind that pleases a close observer. He is straight and wide. His barrel is of good length and his depth is especially noticeable. We know that his purchaser will be more than pleased with him.

He is sired by ANTON'S KING CONFIDENCE 43517, our senior herd sire who traces six times to May Rose 2nd. The dam of Anton's King Confidence has a record of 764.65 lbs. of fat as a junior 4-year-old.

His dam is Content of Prospect A. R. 5960. She is one of the most persistent producers we have in the herd. She easily made the A. R. and is the kind of a cow that always makes good money for her owner. If you want this bull calf write

Hoard's Dairyman Farm
Fort Atkinson - - Wisconsin

Can spare a few fine females.

CORIUM FARM, F. J. Rueping, Owner, Fond du Lac, Wisconsin

Dairy Industry of Argentine

The Rural Society of Buenos Aires, the leading authority in the Argentine Republic in matters pertaining to the animal industry, announces that during the five years 1914-1919 there were imported into that country 29 bulls and 43 heifers of the Holstein-Friesian breed; 15 bulls and 10 heifers of the Jersey breed; 11 bulls and 2 heifers of the Red Polled breed; 21 bulls and 1 heifer of the Red Lincoln breed; 9 bulls and 15 heifers of the Norman breed; and 1 bull and 2 heifers of the Guernsey breed; which goes to show the interest the Argentine breeders are beginning to take in the dairy breeds.

Out of a total of 32,000,000 head of cattle of all breeds, the dairy breeds are represented by 3,000,000 cows, with an average milk production of five quarts per day.

The rapid progress of the dairy industry in the Argentine Republic is shown by the fact that in 1914 the total butter production was 9,307 tons, and the cheese was 5,413 tons; while during the first nine months of 1920 the production reached 20,939 tons of butter, 21,770 tons of cheese, and 10,706 tons of casein; and the number of factories working on dairy products has reached the grand total of 4,364.

The Rural Society is now busily engaged in organizing an International Dairy Exhibition, to be held in Buenos Aires during the coming month of May, and seems to be especially interested in having a large representation from American breeders and manufacturers of dairy products, and particularly of dairy machinery. JERSEYS
The Profit Breed

"The Key to Dairy Profits" and *"Jersey Facts"*—two important books, telling how farmers are making real profit today with Jerseys—how anyone can do it anywhere. Whether you are interested in one cow or a hundred, these books will show you how to make money. Free—Write today

American Jersey Cattle Club, 324-E W. 23 St. New York

Meridale Jerseys
Head Your Herd With a Meridale Bull

The most practical way to increase the profit of a dairy herd is to head it with a pure-bred bull. Such herds average receipts of about $26.00 per cow per year higher than herds headed by a grade or scrub.

A good bull is worth more than his cost to the dairyman. We have a few such young bulls available. They are bred from Register of Merit ancestry, and give promise of being better than their sires. Figure what the *need* of a pure-bred bull is costing you. Write for booklet and pedigrees.

AYER & McKINNEY
Meridale Farms Meredith, New York

HOLSTEINS

All by King Segis Pontiac Cor-Will, 190512, whose sire is King Segis Pontiac, 44444, and whose dam is an A. R. O. daughter of Pontiac Korndyke. Also two fine young registered cows, one a granddaughter of Pontiac Korndyke. Wm. N. Osborn, Wanatah, Ind.

HOLSTEIN CATTLE

N. P. Hanson, Westbury, Minnesota, writes:

"Nine years ago I purchased my first purebred Holsteins, three young heifers and a bull. One of those heifers cost $175 and now has five daughters, four granddaughters and four great granddaughters. For the whole family a conservative estimate of their value is $15,000—not so bad for a $175 investment nine years ago."

The 1921 Sale of Guaranteed Holsteins

Syracuse Sale Pavilion,

March 22, 23 and 24

275—Attractive Individuals—275

THREE BIG DAYS

A Trip Across the Continent

FORTY REPRESENTATIVE EASTERN BREEDERS have picked out for THE 1921 SALE the finest lot of individuals their herds can produce.

IT HAS NOT BEEN POSSIBLE for the management to visit every consignor's herd, but the large number of entries thus far inspected indicate a sale of the greatest array of beautiful individuals ever brought together in the East.

INDIVIDUAL QUALITY has been the first consideration, but records and breeding are not lacking.

THE 60-DAY HEALTH GUARANTY in certain respects offers better protection for the buyer than has ever yet been afforded in any of the great national sales.

THE LARGE NUMBER of animals to be sold offers the widest scope for selection, even to the purchaser of several carloads.

YOUNG COWS FRESH OR SOON DUE constitute a large proportion of the entries. In the sale also are heifers of quality and breeding, a very few calves, and some splendidly bred young bulls good enough individually to win in the show ring and good enough in pedigree to head any herd.

ISN'T THIS EXACTLY THE KIND OF SALE that the careful buyer who wants to make every dollar do the work of two will do well to attend whether he is located near by or, in order to be present, has to make a trip across the continent?

THE SECRETARY, 406 MARKET BANK BUILDING, MINNEAPOLIS, MINN.

This Week We Offer

This Splendid Line-Bred

Sir Pietertje Ormsby Mercedes Bull

Sir Jesse Skylark (307356)

Born February 25, 1920.

He is an excellent individual, well grown and of a rugged type. Through his pedigree he combines a most desirable line of breeding.

HIS SIRE:

SIR PIETERTJE SKYLARK ORMSBY—A young sire combining the blood of Duchess Skylark Ormsby and Sir Pietertje Ormsby Mercedes. He is by the only son of the only 1500-lb. cow and from a 940-lb. two-year-old daughter of Sir Pietertje Ormsby Mercedes, 14 daughters above 1000 lbs. and 60 averaging above 800. The next dam is a 1089-lb. four-year-old daughter of Colantha Johanna Champion (His dam 1247) and from a 1255-lb. daughter of Pietertje Maid Ormsby. Nine nearest dams of this sire average above 1000 lbs.

HIS DAM:

EDENVALE JESSIE ORMSBY—24.76 lbs. butter and 503.2 lbs. milk as a three-year-old. She is a show cow from end to end and one that will make a real record in the future. She is sired by Sir Pietertje Ormsby Mercedes 39th, one of the proven sons of old Sir P. O. M. The dam is from Jesse Rosanna Longfield, a daughter of Parthenea Longfield, a proven sire.

Price $500.00

E. C. Schroeder Farms, Moorhead, Minn.

(Herd Under Federal Supervision).

Minnesota Holsteins

For Your Next Herd Sire

Miss Korndyke Akkrummer Ormsby 30-lb. 4-year-old. 39.67 lbs. butter at full age. Owned and developed by J. B. Irwin.

get a son of Sir Ormsby Banostine Champion, son of Duchess Skylark Ormsby, world record cow. We have some good ones for sale from dams with good 7-day and year records.

Woodlake & Clover Farms,

RICHLY BRED

HOLSTEIN BULL CALVES

out of A. R. dams and sired by our two richly bred herd sires — **King Piebe Ormsby Mercedes,** a 35-lb. son of Sir Korndyke Bess and every dam in pedigree over 22 lbs. and **King Pietertje Mercedes Ormsby,** a son of Sir Pietertje Ormsby Mercedes and out of a 19-lb. senior two-year-old dam.
Herd tuberculin tested. Write for information or visit herd.

P. FROST SPAULDING FARM CO.
C. L. Spaulding, Mgr., Warren, Minn.

Richly Bred Ormsby Bulls

From Yearly Record Dams—Age 1 to 14 Mos.

Six three-year-old heifers in my herd (under ordinary farm conditions) have just finished yearly records averaging 722 lbs. butter from 16,639 lbs. milk. To make room for calves now coming on, am offering at bargain prices three grand individual sons of above cows ready for service. Act quick. Herd under Federal Supervision.

F. A. STILLINGS, Frazee, Minn.

"DUKE"

The only place you can buy sons of serviceable age sired by DUKE PIETERTJE KORNDYKE ORMSBY

The bull selling at the last Minnesota state sale for $33,000.00 is from the herd where he stood for three years prior to the sale. "Duke's" dam now has three records above 1,000 pounds, the last one was 1,190 pounds.
Now is the opportune time to buy one of these bulls as their sisters will be given every opportunity. Get a son now and be in line. Clean bulls from a clean herd. Prices reasonable. Write

EDW. H. ULRICH, Biscay, Minn.

"Before installing the Perfection I examined all the different makes of milkers, and finally decided on the Perfection Milker because it has the most *natural action* of any machine I have ever seen." —GEO. HENTON.

Milk Your Cows Nature's Way

WHY not milk your cows Nature's Way? The calf is Nature's Way of milking. It is impossible for human hands to imitate the calf's action. What human hands fail to accomplish has been reproduced to the last detail in the action of the Perfection Milker. That's why you milk Nature's Way when you milk with the Perfection.

The calf milks with a gentle suction followed by a *downward squeeze* between the roof of the mouth and the tongue and then a moment of rest while swallowing. Put your finger in the teat cup of the Perfection and you find the same action. In no other milker will you find that downward squeeze.

Perfection owners say their cows stand quietly for this natural way of milking and give more milk.

Milk Nature's Way and save yourself time and drudgery. You can milk 24 to 30 cows in an hour with the Perfection. Here's enough saving in wages of hired help to pay for the Perfection in less than a year.

Find Out More About Nature's Way

Send for a copy of the book, "What the Dairyman Wants to Know." It explains in detail this better way of milking. We'll send names and addresses of Perfection owners near you.

Why Milk By Hand? Perfection milks Nature's Way.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Fort Atkinson, Wisconsin Volume LXI, No. 9 March 18, 1921

An Interview with Thomas A. Edison regarding the imperfections of the human voice

[*Introductory Note.*]—The realism of the New Edison is so perfect that this wonderful instrument brings the full benefits of music into every home.

In this interview, Mr. Edison explains, in his characteristic way, why this perfect realism causes him to be exceedingly careful in his selection of artists.

Mr. Edison also makes plain that the New Edison (in addition to RE-CREATING music in conjunction with Edison RE-CREATIONS) plays the talking machine records of all the principal talking machine manufacturers. The New Edison lends improved tone quality to these talking machine records. If you have a favorite artist, who does not record for the Edison Laboratories, you should certainly hear him on the New Edison.

Some five hundred Edison dealers have equipped themselves with Turn-Tables, on which they have placed the New Edison and various well-known talking machines. This Turn-Table permits each instrument to be played in the same position, in the same room, so that an absolutely scientific comparison can be made.

"THE object of an inventor, attempting to produce a phonograph, should be to achieve the highest possible degree of realism. That has constantly been my goal, and, as is now well known, we have succeeded to a point where our phonograph reproduces, or RE-CREATES, the human voice and other forms of music, with such fidelity to the original that the most sensitive ears are unable to distinguish any difference. Our success in registering and emitting every quality of the human voice has revealed some rather remarkable facts.

"I have collected, through my agents in Europe and America, phonographic voice trials by approximately 3800 singers. Of these, there are but 22 who sing pure notes, without extraneous sounds and the almost universal tremolo effect. A singer's trill is quite a different thing from a tremolo. A trill can be and is controlled by the brain, but a tremolo is not within brain control and, so far, there has been no means found for correcting it. Most singers cannot sustain a note, without breaking it up into a series of chatterings, or tremolos. The number of waves varies

from two per second to as high as twelve. When at the latter rate, the chatter can just be heard and is not particularly objectionable. When at a slower rate, it is very objectionable.

Patti Had Pure Notes

"If this defect could be eliminated, nothing would exceed the beauty of the human voice, but, until this is done, there will be only a few singers in a century, who can emit pure notes in all registers. Patti, for example, was conspicuous for emitting pure notes, except in the lower part of her scale, and she was always reluctant to sing a song requiring the use of her lower register.

"The ordinary talking machine gives so incomplete and imperfect a reproduction of a singer's voice that the natural defects of such voice become relatively unimportant, because the defects in the talking machine are so much greater than the defects in the singer's voice. However, in the case of our phonograph, the defects in a singer's voice become very apparent, because we reveal his voice, exactly as it is. Our phonograph applies the acid test to the human voice. There are no realistic stage settings and no dramatic action to key our emotions to a pitch that renders us tolerant of imperfect singing. The impressive stage appearance and histrionic ability of the artist are lost upon us because we cannot see him.

Opera Artists in Concert

"The opera artist has somewhat the same problem when he appears in concert work. Lacking the stage picture and trappings of the opera, the grand opera star frequently fails on the concert platform, because of vocal defects, which are obscured in his appearances on the opera stage. Needless to say, the test, which our new phonograph imposes, is many times more severe than that of concert work.

"*The emotional effects and consequent benefits of music are well known. Through the agency of our new phonograph, and because of its realism, I can produce the same effects as would result from the original music, provided I use artists, who emit pure tones and have artistic potentialities, which are fully felt by the listener, even though he does not see the artists.*

"*I instruct my agents, when listening to an artist, in opera or concert, to close their eyes, in order to approximate as nearly as possible the conditions under which the phonograph will be heard.*

No Truly Perfect Voice

"The foregoing will, I think, make plain why I am unwilling to let an artist do serious work for my new phonograph, unless his voice is free from objectionable defects. I have not as yet encountered the truly perfect voice, but I endeavor to obtain voices that are as nearly perfect as possible; and, no matter how great an artist's reputation may be, I will not record him if his voice is below my standards.

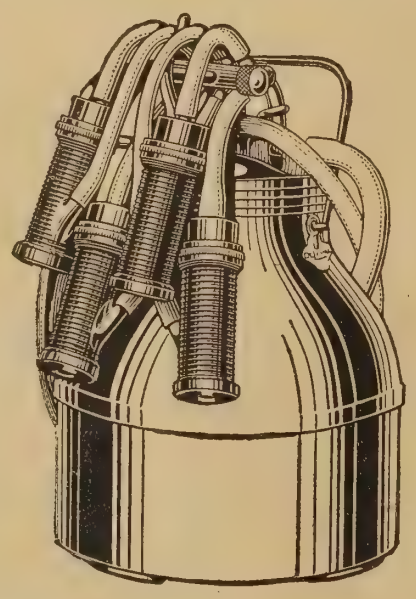
"Even artists, whose voices meet my standards, frequently are not in sufficiently good voice to sustain the acid test of our phonograph. The fact that an artist is in good enough voice to appear in opera or concert, without evoking criticism, does not necessarily signify that our phonograph will not reveal that he is actually in poor voice. We cancel many recording dates for this cause. I believe this practice is unusual elsewhere. The reason for this is obvious, since, if the reproduction is inadequate and imperfect, voice defects, due, for example, to a cold, are not likely to be detected in the reproduction.

Of 3800 singers, only 22 sing pure notes, says Mr. Edison

Admires Stage Personality

"I wish most emphatically to say that I have every admiration for the peculiar gifts of the singer, whose stage presence, or physical charm, enables him, or her, to achieve a great reputation, despite the handicap of an inferior voice, but I hope no one will expect me to record such voices. I realize that there is a certain amount of historic interest in collecting—much as one collects mementos for a memory book—the records of celebrated artists, irrespective of whether their records are truly agreeable to the ear, and I am very glad that the records of all the principal talking machine companies can be played on the New Edison, with the best possible results. Anyone, desiring the talking machine records of artists, who do not make recordings for me, will find that such records (unless they contain extraordinary faults) are given increased musical value by our new phonograph."

The NEW EDISON
"the phonograph with a soul"



The same factors which have made the De Laval Separator famous, are back of the DE LAVAL MILKER

Just as the De Laval Cream Separator established new and higher standards of efficiency and construction, so is the De Laval Milker establishing higher standards among milkers. It is strong; durable; simple in construction and operation; easy to keep clean; saves time, and increases production.

The same policies which have made the De Laval Cream Separator the most popular and most widely used in the world are back of the De Laval Milker and are responsible for its rapidly increasing use.

Long ago the De Laval Company recognized the need for a mechanical means of milking, to place the dairy business on a machine basis. For over twenty years experiments have been conducted, and after many years of research, test and use, and not until the De Laval Company was absolutely sure its milker was actually a better way of milking, was it offered for sale. Now after four years of commercial use, in all sections of the country, owners are proving that it not only saves time and eliminates the drudgery of milking, but it actually increases the flow of milk even over good hand milking.

Service also helped make the De Laval Separator famous; and it is service back of the De Laval Milker that is helping to create preference for it among dairymen. This means that the De Laval Milker will be properly installed, that you will be thoroughly instructed in its care and operation, and that the De Laval Company's interest in you, instead of ending there, just begins.

The De Laval Separator has rendered a service of inestimable value to the dairy industry — the De Laval Milker is doing the same. It removes the one great drawback to dairying — hand milking. American farmers realize the service, stability and integrity back of the name "De Laval," all of which is reflected in the rapidly increasing use of De Laval Milkers.

Write for full information concerning the De Laval Milker

The De Laval Separator Company

Volume LXI — FORT ATKINSON, WIS., MARCH 18, 1921 — Number 9

Does the Show Ring Fulfill Its Purpose?

Experiences on the 1920 Circuit Indicate That There Is Need for Better Ideas of What Constitutes the Ideal Type

E. G. WOODWARD, State College of Washington

ONE of the chief values of the show ring is to point out correct types to the beginner in the breeding business, as well as to indicate the path of progress to older breeders. If the show ring is to accomplish this purpose, the same type of animal must be ranked highest in each ring; otherwise confusion in the matter of type will be the result of a series of shows.

If a beginner in the business sees a Holstein heifer placed first in her class and later made junior and grand champion of a show, and two weeks later sees this same animal led into the ring only to be left in the discard without even being brought into line for placing, he must naturally wonder if there is any such thing as approved type in Holsteins. Some difference in the placing of animals in different show rings is bound to occur, due to a change in competition, and also to a change in the animals themselves. However, if there is an approved type and the judges are competent, the placings on a given circuit where the shows follow each other at short intervals should come near agreeing.

The writer had some interesting experiences last fall in showing three breeds of cattle at four of the leading shows of the Northwest, and, inasmuch as he has also at times acted as judge and has done his bit in making radical changes in the placings of other judges, he takes the liberty of pointing out some of the interesting occurrences on last fall's show circuit. The shows included are: The Spokane Interstate Fair, the Walla Walla Agricultural Fair, the Washington State Fair, and the Pacific International Live Stock Show. The instances cited are from the Jersey and the Holstein breeds, and the judges who placed the awards are, for Holsteins, F. S. Stimson, Washington; H. P. Davis, Idaho; C. F. Jenness, Iowa; W. S. Moscrip, Minnesota; and for Jerseys, Harry West, Oregon; H. P. Davis, Idaho; F. H. Scribner, California; George W. Sisson, Jr., New York.

The following table, with one exception, was made up of animals from the show herd of the State College of Washington. In each instance the two animals compared were shown in the same class, and usually by the same person. The table is not presented to show a change in rank at the different shows as that is to be expected with a change in competition. It is presented, however, to bring out the fact that the order of placing of each pair of animals changed and, further, that in certain instances other animals were placed in between the animals making up the pairs regardless of which was placed highest.

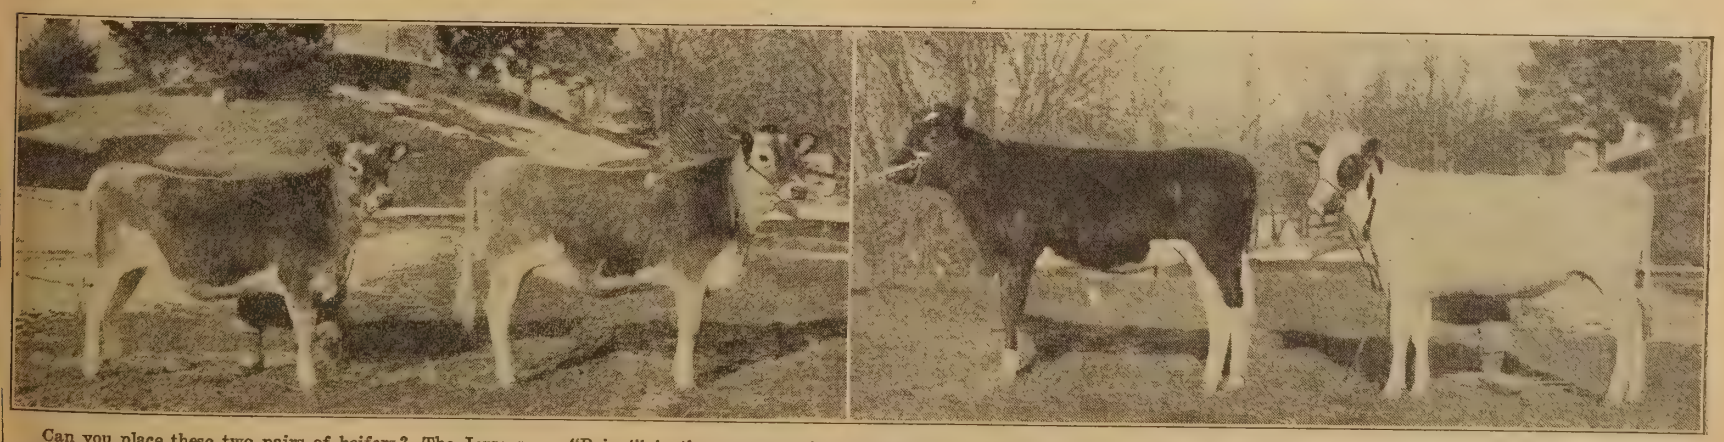
Animals	Show I	Show II	Show III	Show IV
		Pair 1		
A	2nd	3rd	7th	11th
B	1st and Gr. Champ.	1st	not placed	not placed
		Pair 2		
A	6th	4th	1st and Jr. Champ.	not shown
B	5th	1st	2nd	not shown
		Pair 3		
A	1st	1st	1st and Gr. Champ.	8th
B	2nd	2nd	3rd	2nd
		Pair 4		
A	7th	5th	3rd	8th
B	3rd	3rd	2nd	11th

Pair No. 1 brings out the fact that at the first two shows B was placed over A, and in addition was made grand champion at one show. At the second two shows, A was placed over B.

Pair No. 2 shows a similar change, in that B was placed over A at the first two shows, while at the third show A was placed over B, and was also made junior champion. At the fourth show these two animals did not compete.

In the case of Pair No. 3, the judges at the first three shows agreed as to the placing, in each case putting A over B, and at one of the shows making A the grand champion in addition to placing B third. In the fourth show A was placed eighth and B second.

In case of Pair No. 4, at the first three shows B was placed over A. At the first show there were three animals in between the two, while at the fourth show, the placing was reversed with two animals in between.



What does the study of these winnings point out to a beginner regarding type? If a beginner had attended the first show and studied the winners there with the idea of trying to establish their type in his own herd he would be breeding for a somewhat different type of animal than his neighbor who attended the third show and studied the prize winners there. Is the show ring fulfilling its purpose where placings change as indicated in the preceding table?

A study of such instances forces a person to arrive at one of two conclusions: First, either the ideal type is a very hazy thing; or, second, judges are decidedly incompetent. The second of these conclusions can hardly be held, as there is no doubt but that the judges selected in the Northwest are as competent as those selected for any region of the country. The fact remains that the placings vary within wide limits, so that the first conclusion seems to be the correct one.

If the ideal type is a hazy thing, what can be done to make it less hazy? There is no question but that the approved type changes with time. In most breeds there have been some changes in the past twenty years. However, when type changes within a week, it seems that it is changing entirely too fast even for this rapidly progressing age.

Some may say that the different breed associations have adopted score cards which point out the approved type. That the score card will not remedy the condition mentioned is shown by the fact that a class of students after being instructed in a body and given practice in the use of a score card will arrive at widely different scores on the same animal. The score card as it stands merely reduces the problem to a number of details without solving it. The difficulty lies in the fact that the descriptions on the score card do not mean the same thing to different people, and until this condition can be remedied there is no doubt but that there will be wide differences of opinion among men who apply the score card in show ring judging.

I believe that two things might be done to unify the show ring judging, and thereby make our stock shows very much more valuable as demonstrations of correct type. The first is the publishing of a complete set of illustrations by each breed association to go with the scale of points. In other words, when the Jersey scale of points describes an ideal udder this description does not mean exactly the same to two persons. This ideal udder might well be illustrated by a series of photographs from different angles to point out exactly what the udder described in the scale of points looks like in life. In my opinion, these illustrations should be actual photographs rather than the productions of an artist. If it is not possible for a committee appointed by a breed association to agree upon suitable illustrations for the score card, it cannot be expected that judges will agree as to the type described by a scale of points. I realize that the illustrations might be very difficult to obtain yet it is a matter which in my opinion warrants considerable effort. The other thing that might be done is for the breed associations and show officials to be even more careful than in the past in the selection of official judges. Naturally, only one who will subscribe to the scale of points as illustrated should be designated as an official judge for the particular breed.

Can you place these two pairs of heifers? The Jerseys are "Pair 4" in the accompanying discussion. In three shows A, at the left, was placed under B; in a fourth, A was rated higher. Which do you like better of the two Holsteins, whose show record is given as "Pair 1"? In two shows B, the white heifer, was given the blue ribbon, being grand champion in one. In two other shows A was placed while B was left out of the money entirely.

Simple Ways of Feeding Dairy Cows

[A continuation of a practical feeding discussion begun by H. P. Davis, Professor of Dairying at the University of Idaho, in last week's issue of Hoard's Dairyman. In this concluding article Mr. Davis gives a simple method of balancing practical dairy rations and lays down workable rules of value to every feeder of milking cows.—EDITORS.]

Much has been written about balanced rations and their necessity. Too frequently the idea has been created that a balanced ration is so hard to prepare that the average dairyman can make but little use of it. In fact a balanced ration is by definition simple, namely nutrients, or food materials, supplied in quantities to exactly supply a cow's needs for maintenance and milk production.

In balanced rations there are several constituents necessary: protein, carbohydrates, fats, and mineral material. Protein is the name given to a large number of substances all of which contain the element nitrogen. Protein is needed for making blood and it is one of the chief constituents of the skin, hair, lean muscle, and milk. It is absolutely necessary that a definite part of the ration be protein as nothing else can be substituted for it.

Carbohydrates include a number of substances, the most commonly known of which are the sugars, starches, and crude fibre. This group furnishes fuel to carry on body functions or, in other words, is a source of energy.

Fats are a third class of substances and their use is similar to that of the carbohydrates except that they are 2¼ times as valuable as a source of energy. Since the fats are used for practically the same purposes as the carbohydrates for practical feeding, they may be considered together. Protein can also furnish energy and for that purpose it is equal to carbohydrates pound for pound.

Mineral material, especially lime and the phosphates, is needed in considerable quantities by the dairy cow. Bone and milk make large drains upon both lime and the phosphates and the demand must be met by the feed.

Grain Mixtures

The making up of a ration need not be a complicated matter. A simple method is to make up a grain mixture that will balance with the available roughage when fed in proportion to milk yield. Certain things must, of course, be considered in the grain mixture to make it of the greatest efficiency.

Cost: No one can forget the all important item of cost in feeding. Dairy cattle should be fed as economically as possible. Economy, however, does not mean the use of feeds that are cheap per hundredweight but feeds that furnish the various constituents at the lowest cost. Protein is usually the most expensive of the nutrients so that special efforts should be made to obtain it as reasonably as possible. To determine the cost of a pound of protein as furnished by any feed, divide the price of 100 pounds by the per cent of digestible protein it contains. If this calculation is made for a number of feeds, the economy of each as a source of protein will be readily apparent. In like manner the cost of carbohydrates can be obtained. They are not quite so important as far as cost is concerned since a large part of the carbohydrates needed is furnished by the roughage. Generally speaking, in making up a grain mixture, the cost of protein is one of the chief considerations.

Bulk: Heavy, compact concentrates are difficult to digest because of their mechanical condition. It is of the greatest importance that the feed value of any grain or grain mixture be not reduced because it is not readily digested. In making up a grain mixture at least a third and preferably a half of the mixture should be composed of light bulky feeds.

Roughly, concentrates may be divided into three groups according to their heaviness or compactness:

Bulky—Loose	Medium	Heavy—Compact
Alfalfa meal	Corn meal	Cottonseed meal
Wheat bran	Hominy meal	Linseed meal
Corn bran	Gluten feed	Cocoanut meal
Dried beet pulp	Barley (ground or rolled)	Peanut meal
Corn and cob meal	Ground rye	Soy bean meal
Ground oats	Buckwheat middlings	Wheat middlings
	Rice polish	

Palatability: Since the attractiveness of feed to the taste is a means of increasing the quantity eaten, it is important that a grain mixture should be palatable to the cows. This means that if unpalatable feeds are included there should be enough palatable ones used to make the whole feed palatable. It is believed by many persons that a grain mixture containing at least four grains or concentrates will be palatable and relished for a longer period than a mixture of only two grains, for example. Perhaps for the average cow the question of palatability is not so important, but in the high producer it is one of the essentials of successful feeding.

Physiological Effect: By physiological effect is meant the influence that the feed will have upon the digestive organs, the general health of the cow, and upon the milk and its constituents. Linseed oil meal is known to have a laxative effect upon cattle as does wheat bran also, but to a less marked degree. Cottonseed meal, on the other hand, is constipating and when fed in large quantities tends to produce an undesirable effect upon the cow. Butter from cows fed upon large quantities of cottonseed meal tends to be whitish, hard, and crumbly. Oats and wheat bran, for example, are good conditioners. The effect of the mixture in connection with the roughage has to be guaged also.

Minerals

In considering the feeding of cows until very recent years, the usual practice has been to consider that the cow received enough minerals of all kinds in any ordinary ration to meet her needs. We now know that many rations lack certain elements and there is reason to believe that this lack sometimes seriously limits milk production.

The practice of giving animals common salt is too old and too common to need comment. We know that the average cow requires about an ounce of salt every day. A good practice in giving salt is to add about one per cent by weight to the grain mixture and in addition provide either rock salt or coarse ground salt in a convenient place. The latter kind of salt is to be preferred since cows will frequently develop sore tongues from licking rock salt and even then not get all they need.

Of the various minerals that are needed by the cow, and of which our present knowledge seems to indicate that there may frequently be a deficiency, the most important are lime, phosphoric acid, or combinations of the acid with lime or magnesia, and potash. Probably medium and low producing cows can store enough mineral salts during the summer pasture season to last them through a lactation period even though at certain periods the feed may be deficient in those substances. The cow giving large quantities of milk produces large quantities of lime and phosphates and, unless very carefully fed, is compelled to draw upon her body reserve. Such a condition will very likely reduce the production in succeeding lactations.

A study of the chemical analyses of common feedstuffs shows the superiority of legume hays as sources of potash and lime. Also, the importance of bran from its potash and phosphoric acid content will be readily realized when its analysis is known. Such facts should be considered in the final composition.

Grain Mixture to Balance Roughage

With the exception of the legumes, the stems and leaves of plants are largely sources of carbohydrates while in the seeds is found a larger proportion of protein. In general, therefore, the roughage is considered chiefly as a source of carbohydrates or energy, while grain is expected to balance up the ration by supplying the needed protein. By using legume hay a greater part of the protein of the ration can be supplied in the form of roughage. That is desirable and usually economical.

For the purpose of balancing rations, roughage may be divided roughly into two general classes, high protein and low protein. An intermediate class is also necessary since part of the roughage may be from each class. In the high protein class are included all the legume roughages such as alfalfa hay, the clovers, cowpea hay, soy bean hay. The low protein class includes timothy, millet, prairie hay, straws of the cereal grains, corn stover, corn silage, cottonseed hulls, etc. The combination class includes mixed hay, oat and pea hay, or any combination of the first two classes where approximately half of the roughage is from each class.

Since it is not practical on most farms to feed each cow separately, the best plan is to determine the average and make up a grain mixture that when fed in connection with the roughage will supply all the nutrients needed. Under this plan the grain is fed in proportion to the milk yield. To make the plan even simpler it is assumed that if the cow has all the good roughage she will eat up clean and is fed grain in proportion to milk yield that she will receive enough carbohydrates.

Simple Rules for Compounding a Grain Mixture

1. Make up the mixture to fit the roughage. For low protein roughage, the mixture should have from 18 per cent to 22 per cent of digestive protein. High protein roughage requires from 13 per cent to 16 per cent of digestible protein and combination roughage from 15 per cent to 18 per cent of digestible protein in the grain mixture.

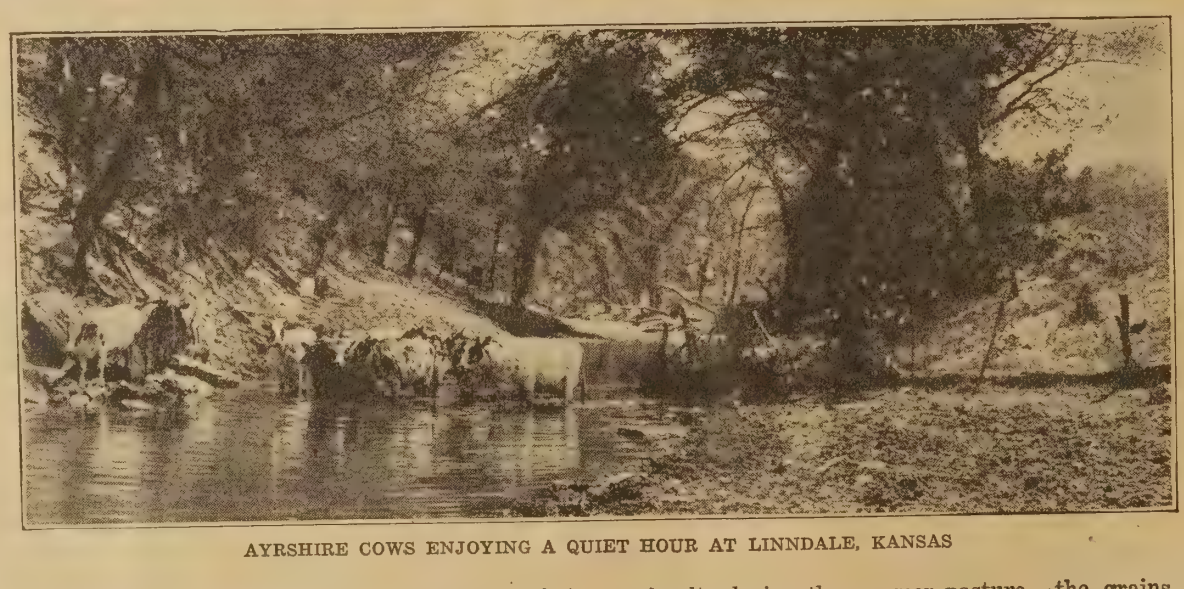
2. Select grains that furnish protein at the least cost, using home-grown grains if possible.

3. Be sure that at least one-third, and preferably one-half, of the grains or concentrates are light and bulky.

4. Keep in mind palatability.

5. See that the grain mixture has the proper physiological effect when fed in connection with the roughage.

6. There should be plenty of lime, phosphoric acid, and potash in the mixture.



Digestible Protein in Concentrates

The following table gives some of the more common feeds so grouped:

5 per cent average (2.5 to 7.4 per cent)	10 per cent average (7.5 to 12.4 per cent)
Corn meal	Ground oats
Corn and cob meal	Barley (ground or rolled)
Hominy feed	Ground rye
Dried beet pulp	Ground wheat
	Ground buckwheat
	Ground sorghum grains
15 per cent average (12.5 to 17.4 per cent)	20 per cent average (17.5 to 22.4 per cent)
Wheat bran	Gluten feed
Wheat middlings	Malt sprout
	Coconut meal
	Peanut meal (with hulls)
	Ground cowpeas
25 per cent average (22.5 to 27.4 per cent)	30 per cent average (27.5 to 32.4 per cent)
Buckwheat middlings	Gluten meal
	Linseed meal (both processes)
	Soy bean meal
35 per cent average (32.5 to 37.4 per cent)	40 per cent average (37.5 to 42.4 per cent)
Cottonseed meal (choice)	Peanut meal (hulled nuts)

The different concentrates may b

AYRSHIRE COWS ENJOYING A QUIET HOUR AT LINNDALE, KANSAS

How, When, and What of Soy Beans

GEO. M. BRIGGS, Wisconsin College of Agriculture

IN the live stock business the man who loves his particular breed prospers. From the standpoint of field crops, not only is it necessary for the farmer to love the handling of all crops, but the particular crop which he is handling must be the one which is best adapted to his soil and the variety which is best for the use it is to be put to. From the soy bean standpoint so much has been published the last few years concerning varieties, etc., that at first thought it seems unnecessary to go into details concerning varieties; however, after mingling with farmers here and there over Wisconsin, and knowing their wrong ideas concerning soy bean varieties, it might be wise to just mention a few things about soy bean varieties.

Perhaps the majority of people in Wisconsin know what the little Wisconsin Early Black soy bean looks like. Last October I was visiting a farmer in Rusk County who had planted soy beans, and upon inquiry found that they were Early Browns. In that he had some few seeds saved over, I requested to see them and they were our common little Wisconsin Blacks. So with this experience fresh in my mind, is it any wonder that I say a few words about soy bean varieties. A majority of the soy beans raised in this state are of this Early Black variety, the plant being most widely used as a seed producer. This plant matures in from 90 to 105 days, ripening some pods even earlier in a dry year when plant development has been hindered.

Three varieties being quite extensively grown and maturing seed in this state are Ito San, Manchu, and Black Eyebrow, all of which come into the middle maturing class requiring from 100 to 115 days, depending upon the season, for ripening. All three of these varieties are extremely popular in this state for most any purpose, their success depending upon season and fertility of soil. The Ito San bean can easily be identified, being a small yellow bean and having a small black dot at the end of the leaf scar. The Manchu variety is slightly larger than the Ito San, is yellow, and has the whole leaf scar dark. As the name indicates, the Black Eyebrow is green and dark in color, or if exposed to the light much and old may be yellowish green and dark. The dark covers the leaf scar side and extends part way up to the middle on both flat sides of the bean. A green bean known as Early Green, also a brown bean called the Early Brown, are both grown in this state in small quantities. The green bean is probably a few days later than the Ito Sans, while the browns rank about the same in growing period.

Inoculation Necessary

Regardless of purpose, if beans are planted for best results and success, whether for seed, silage, hay, or green manure, they must be inoculated. When once beans are planted on a field, perhaps inoculation need not be applied for several years. My advice, however, would be to apply it just the same. Artificial cultures can be procured from the Agricultural College for a very nominal fee, and if an old soy bean field is close by, some soil directly beneath the row can be taken and mixed with the soy beans after moistening them slightly with water, sweetened slightly with molasses, or sugar, or mixed with glue so that the soil will adhere. A very small amount of soil is necessary, one quart being enough for a peck of beans providing it is soil containing soy bean bacteria. Care should be exercised in keeping the inoculated beans from being exposed directly in the light. It is also important to have good germinating beans. Our Wisconsin grown beans may germinate well but like all other soy beans, regardless of where they come from, should be tested a short time before the planting season. If there is anything that makes a person regret, fret, and grow old it is to plant seeds that don't grow. If there is anything that will make a county agent unpopular, or a seed house unpopular, it is to have Mr. Farmer plant some seeds they have been instrumental in furnishing and to find out that they don't grow. Soy beans lose their germinating power quite fast. Should a farmer carry any over or buy some early, by all means test them before planting. Another precaution might be added, that of not planting too deep. Plant down to moisture but stop there. If germination would be real good and soil light, may be in cool weather they would come through, but in heavy soils the chances would be against you—so be careful not to plant too deep.

D. K. BARRETT, WISCONSIN, CUTTING SOY BEANS IN FALL OF 1920 WITH MOWER

In dry years when beans don't get very high a mower is about the only machine that can get them. However, should the farmer have an old fashioned reaper, less work will be required in handling than with a mower, as the reaper leaves them in small bunches which can be left for curing.

How, When, and What of Seed Crop

Generally speaking, if attempting to raise soy beans for seed, plant Early Blacks where No. 8, No. 25, and other early white or yellow dents will mature. Where early selection of Wis. No. 7 or Golden Glow will mature, the best and safest beans are Early Blacks. However, many years the medium maturing varieties, such as Ito San, Manchu, or Black Eyebrow, are planted and in ordinary years would come through safely providing they are planted early, kept clean, and cultivated thoroughly and persistently. In those sections where Silver King and Golden Glow corn mature in ordinary years, these medium maturing varieties can usually be depended upon to mature for seed. The Early Greens would be fitted only to this last mentioned section in that they are a few days later than these medium maturing varieties. It is difficult to recommend any certain variety because their growth depends so much upon seasonal and soil conditions.

Soy beans have been planted in various ways for seed. Some use corn planters, as they are, narrowed up, or driving back over the rows, putting a row in between each planter track. Another method, quite extensively used, is to use a common grain drill, closing up some of the spouts by putting a tin or board on the inside of the box so that only spouts every 24 or 30 inches apart will be seeding. Then there is the beet drill, common hand garden drill, little hand corn dropper, all of which are being used by various farmers through the state.

A few farmers have experimented by planting soys solid, either drilling or broadcasting for seed, but due to the many weeds that seem to thrive this practice is gaining no headway. Generally speaking, putting beans in rows, a bushel will plant from 2½ to 3 acres, depending upon size of beans and distance apart of rows. If drilled solid, between 1¼ to 1½ bushels would easily be used. V. P. Atwell, who last year planted over 150 acres of soy beans, believes it wiser to plant thin rather than thick to get results as seed, having the plants spaced from five to eight inches rather than from two to five inches. This planting distance will vary with fertility of ground, but even on fertile soil should drouth occur naturally a greater setback will result than where thinner. Mr. Atwell is also a firm believer in early planting and this last season started planting his soy beans on May 3 quite a while before regular corn planting time. P. W. Jones is also of the same belief, in that it is better to get them started early and have the frost touch them slightly, than to have them frozen in the latter part of the season. With the dry season of 1920, however, Mr. Atwell experienced having his early planted beans lose their leaves and stop growing much sooner than those planted later. If I were to forecast the future, I would say that early planting will be the rule.

How Cared For

Charles Ristow was perhaps Wisconsin's first advocate of cultivating soy beans with a weeder. Many farmers are now following this practice, finding that, where rain doesn't hinder them from getting on the field when the weeds are small, by cultivating crossways, kit-a-corner, lengthwise and any old way, weeds are kept out with only a part of the effort it took with a regular cultivator. Some farmers, however, believe that for best results this weeder should be supplemented at least once by a cultivator to stir up the soil a little deeper and get out some of the remaining weeds. The important thing is to keep the weeds out regardless of how it is done. On Mr. Ristow's farm this past summer and in an old hog pasture where weeds got the start of the beans, the yield was easily cut in two. Lambsquarter, smart weed, and sand burs grew until they destroyed at least six bushels to the acre.

For cutting and curing soy beans no special machinery need be bought, a grain binder, grain reaper, or mower with clover or pea attachment being used the same as for other crops. In threshing, however, care must be exercised by the thresher to keep the machine speed low and probably remove most of concaves in order to avoid splitting the beans. Special machinery can be bought for threshing beans should any one farmer or neighborhood decide upon raising any quantity for seed. A careful thresherman, however, can do a pretty good job with a common machine, but it has to be run slowly and adjusted so as not to break too many beans.

Soy Beans as Hay

For a hay crop the only place I would recommend them to be planted in solid drill or broadcast would be on new soil free from weeds, or in localities with heavy rainfall. In Northeastern Wisconsin soy beans planted solid might prove very popular some years because of heavy rainfall, or on swampy low soils in other parts of the state, but for the greater part of the state the same method of seeding and caring is best for hay as is recommended for seed, only the plants could be from 2 to 4 inches apart in the row so as to make finer stems.

In the north half of the state on sandy, fertile soils, or in the south on pieces of land likely to be caught by frost, the Early Blacks have proven very popular. On French Island near La Crosse this year these Early Blacks attained a height about the same as other later varieties, being from 28 to 32 inches high. In Wabena in Forest County, these Early Blacks also reached about the same height as Ito Sans. There are many varieties which will grow bigger, but in selecting a variety for hay, we must keep in mind the fact that they cure best when weather is warm and dry, and the latter part of August is much preferred to the middle of September, so we want a bean ready to cut at that time. These Early Blacks on the poorest of soils in all parts of the state may prove too small for hay in a dry year, and the medium maturing varieties would be superior. In our test at Marshfield this past season, the Manchu proved superior to all other varieties tried as a hay crop. The next best was the Mongol, known in Northern Indiana as the Hollybrook, but the Early Green wherever tried approached the leafy, stiff stemmed character of this Mongol variety.

(Continued on page 391)

Soy beans can be put in small bunches to cure for hay or seed. In average years this crop will be as easily handled for hay as any other legume.

Power and Production

R. U. BLASINGAME, PENNSYLVANIA

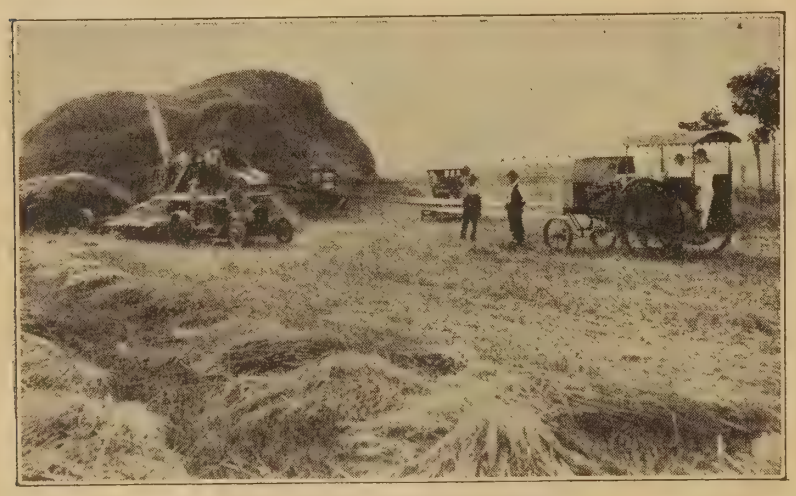
ONE hundred years ago about ninety per cent of the population of the United States resided in rural districts and were occupied in agricultural pursuits. The 1910 census shows that only 35 per cent of the population of the United States are employed in farming. This means that at the present time each farmer is producing from three to four times what his ancestors were able to produce. His ability to produce more than his forefathers lies in the fact that he employs agricultural machinery to prosecute his farm work.

An investigation was conducted during 1917 by the United States Department of Agriculture among over six hundred farmers in the state of Illinois who used gas tractors. The investigation shows that one-third of these farmers were able, through the use of mechanical power, to increase their number of acres during the war, yet experiencing one of the greatest shortages of farm labor known since the Civil War.

As a result of a similar investigation covering 200 tractors, conducted in the same state among tractor owners in the previous year, less than eighty per cent of the farmers made the statement that power farming equipment was profitable, while the investigation conducted during the following year, which has been referred to above, indicates that ninety per cent of the power farming equipment had proved to be profitable. This indicates two things: First, that the new agricultural tractor has been improved and that the tractor operator is becoming more skilled in the operation and maintenance of his machine.

Some of the advantages of the tractor as enumerated by the Illinois farmers ran as follows: With the use of the tractor, a greater amount of work can be done in a short time during hot weather; the use of the tractor enables the farmer to increase his number of acres; with the use of the tractor, the hired man may be dispensed with; the tractor is adapted to belt work. The main disadvantages seem to be the lack of skill and experience in the operation and maintenance of the tractors, and in the matter of delays caused by poor service in replacing repair parts. These two disadvantages are easily overcome. Many tractor dealers are inspecting each machine that they sell every thirty days to see that it is in working order. The man making the inspection carries a number of repair parts with him in a light car. So far as service is concerned, when there are enough tractors used in a particular neighborhood to justify the dealer in rendering such service, the tractor should not be out of operation more than a few hours at a time. The matter of skill in operation is merely a matter of education, and here again the tractor dealer in many localities is spending one to three days with the tractor purchaser, in order to show him every minute detail of the tractor in order that he may know his machine, and be able to give it the right kind of care.

DISKING AND HARROWING AT THE SAME TIME



The tractor stands today in the same place that the grain binder stood during the Civil War. The grain binder was invented by Cyrus McCormick in 1831, but was never used to any great extent, on account of the enormous supply of cheap labor, until the Civil War made the labor shortage very noticeable. At this time, and under such circumstances, the grain binder came into its own, and since that time has grown to be one of the standard and specialized agricultural machines, a machine which is indispensable in modern farm operations. In fact, Ex-Governor Laubet of France made the statement a few years ago that "the French nation would starve to death if it were not for the self-binders manufactured in Chicago."

While the tractor was being used to quite a great extent before the World War, the shortage of labor during hostilities stimulated its use, as is indicated by figures obtained by the United States Department of Agriculture in investigating the number of tractors that are being manufactured. From 1916 to 1917 the increase in the number of tractors manufactured was 111%; during the year 1917 to 1918 the increase was 120%, and from all indications, the following year the increase of machines was over 200%.

The tractor has indicated its usefulness. During this period of the shortage of farm labor, and from all indications, many farmers are purchasing tractors now, who a few years ago did not consider their use to be practical.

The tractor offers an attractive job for the southern negro. The negro is capable of operating an automobile;

AN OHIO THRESHING SCENE

Humoring Dame Nature in Crop Production

ORIN CROOKER, ILLINOIS

Most farmers stop short of sufficient work upon the seed bed and most of them also shirk in the way of sufficient cultivation. Nature, however, is a curious dame who has her own ways of accomplishing results. He farms best who seeks to humor her and gain his ends along the line of least resistance to her likes and dislikes. Diplomacy can be utilized to advantage in farming quite as well as in affairs of state.

IN these days of spring and early summer, while seed beds are being prepared and crops are being cultivated, it is well to understand that there are some things of even more importance in crop production than the amount of plant food in the soil. This will seem a startling statement, perhaps, to many who have been following farm practice for years. It is a common notion that if a soil is kept bountifully supplied with plant food crops must necessarily grow and give a good account of themselves. Usually they do, but it is not wholly the plant food that is responsible for such returns. The physical properties of soils influence production far beyond what is commonly supposed. It is our purpose in this article to point out some of the relationships that exist in matters of this kind. Spring and early summer are good times to put one's understanding of such things into practical operation.

The earliest knowledge of men, both in physics and chemistry, was grouped around what were supposed to be the four elemental substances. These were earth, water, air, and fire. Such a classification appears to us in these days very crude of course, but as a basis for the wonderful development that was to come in subsequent generations it served admirably. To minds groping for understanding in those early times, earth, water, and air seemed to be purely elemental. Practically everything known could be classified roughly under these heads. Fire was a mystery, so it was placed by itself. Present day understanding, of course, has eliminated the idea of either earth, water, or air being elemental. We know that the earth's crust is made up of nearly a hundred elemental substances; that water is a chemical combination of two gases and that it may hold many substances in solution. Air we know to be a mechanical mixture of three or four gases—some of which have escaped recognition until very recently. However, so far as this article is concerned the ancient classification will serve very well, for the physical properties of soil (earth) depend largely upon both water and air, while "fire" comes into our considerations under the guise of temperature. We will take up the last three in the order named and in so doing see the bearing which each has upon the first.

I. Water. Water exists in the soil in three well defined ways. It is always water, so far as its chemical composition is concerned. It is in a liquid, not a gaseous, state. Physically, however, its relation toward the soil is widely different in each of the three ways in which it is held.

First is what is known as *hydrostatic* water. This is the water that exists below the upper level of the "water table", or ground water. There is a depth in all soil, varying from a few inches to many feet, below which the spaces between the soil particles are entirely filled with water. This is spoken of as the "water table". The water below this level constitutes a great reservoir from which it is possible as a rule to draw a large measure of help by proper methods of soil handling.

Second is what is known as *capillary* water. This is water that is drawn upwards in soil from the water table by the power of capillary action, just as oil rises in a lamp wick from the body of oil below. It is this water that is most valuable in ordinary cropping.

Third is what is known as *hydroscopic* water. This is the film of moisture with which each soil particle is surrounded. It is of no great importance, so far as our present consideration is concerned. Hydroscopic water is so tightly held to the soil particles that neither gravitation nor capillary action will remove it. No matter how dry and powdery a soil may appear to the sight or touch this

moisture is present. It may be removed only by oven heat.

Having seen in what forms water exists in soils let us now consider the bearing of water on crop production. Without moisture to absorb plant food there could, of course, be no such thing as a growing plant. Plants take such of their sustenance as they do not derive from the air in the form of "soup", a watery solution of the soil minerals upon which their roots feed. This "soup" comes to the plant in two ways. It may be in the form of rain water which has absorbed soluble plant food after it entered the soil, or it may be in the form of capillary water which has crept up through the soil from below and picked up on the way such soluble mineral salts as lay in its path. Rain water, of course, tends to seep downward through the soil and enter the reservoir of ground water below A portion, however, is retained by capillary action.

It is evident from what has been said that if rainfall were sufficient and came with clocklike regularity farmers would not need to concern themselves very much over any other source for the "soup solution" which crops demand. This, however, is not the case. There may be long periods between precipitations during which dependence must be had upon the water that rises from below through capillary action. Here, then, is a goal toward which to work in farm practice. It is possible to so handle a soil that its power to bring up water in this way may be greatly increased. It is a physical law that the height to which water will rise by capillary action depends on the size of the spaces through which it creeps. The finer the spaces the more slowly but further will water work in this way. There are two means of accomplishing this end. Deep rooted crops leave minute channels through the subsoil, often to a depth of several feet below the plow line. This is of great aid in promoting capillarity. The proper pulverizing of a seed bed operates to retain moisture, while frequent cultivation of its surface serves to check evaporation. It is important to recognize that not only should moisture be coaxed from below and held in the close proximity of plant roots, but evaporation at the surface should be retarded as much as possible. Stirring of the top soil tends to loosen it and increase the space between the soil particles. Water will rise from below in obedience to the laws of capillary attraction until it reaches this loose and mellow earth. Here it is in a measure stopped because of the larger air spaces through which it will not move so freely.

II. Air. A soil must have air as well as moisture in order to be productive. If the soil spaces are filled with water, air is crowded out and plants turn yellow and die. Hence the necessity for proper drainage and the lowering of the water table to a point well below the depth reached by the roots of plants. Air is of great importance to the bacterial life of a soil without which crop production would be at a standstill. The minute organisms, for instance, which convert organic matter into nitrogenous plant foods must have oxygen in abundance. If this is denied them through lack of air they are totally unable to do their appointed work. There is, however, danger of having a soil too loose. Air is a poorer conductor of heat even than water. If a seed bed, for instance, is not sufficiently pulverized the air spaces will remain large. This will not only lessen the amount of capillary water that will ascend to the region of the plant roots but the excessive amount of air between the soil particles will lower the temperature of the soil. It is here that the importance of rolling the seed bed is seen. After a

Yard and Breeding Stall for Vicious Bull

ONE of the problems which comes to the owner of many dairy bulls is how to handle them and not be in danger from them all the time they are being handled. The accompanying photograph shows how a farmer living on Washington Island, Wisconsin, solved the problem to his own satisfaction.

A pen about 24x40 feet is built so that the barn forms one side of it. The bull thus has a box stall in the barn the doors of which may be closed from the inside and the bull either kept in the barn or shut out of it.

On one side of the yard and about three and one-half feet from the fence on the outside is built the breeding stall. Exactly opposite the back of the stall is a four-foot gate in two sections. When these are open they connect the stall with the yard. A cow can easily be led into the stall from the outside. The doors can then be opened and the cow served. The bull can be driven back and the doors closed.

With a yard and stall of this kind the owner of a bull is never required to handle the bull, never has to go in the enclosure with him, and always has him under control. It is a safe, economical, and practical way to care for a vicious bull of any breed.

The accompanying photograph shows the stall with the doors open thus connecting it with the bull's pen.—D. S. Bullock, Washington, D. C.

"Dandelion Butter Color" Is Big Prize Winner

Be sure and use Dandelion Brand Butter Color and give your butter that June golden shade which brings top prices —pleasing the eye and tempting the palate.

The High Scores of 1920

In many of the State Buttermakers' Shows, first awards were won by users of old reliable "Dandelion Brand." You can't miss by giving a trial to the butter color which helps 90% of the successful buttermakers of America.

Never gets rancid. Doesn't affect flavor,
Doesn't color the buttermilk. Leaves no sediment,
Colors more butter to the gallon.

Dandelion Brand Butter Color is purely vegetable and fully meets requirements of all Food laws—State and National. Ask your jobber for prices.

WELLS & RICHARDSON CO., Inc. BURLINGTON, VERMONT

Yield of Each Cow Figured for You

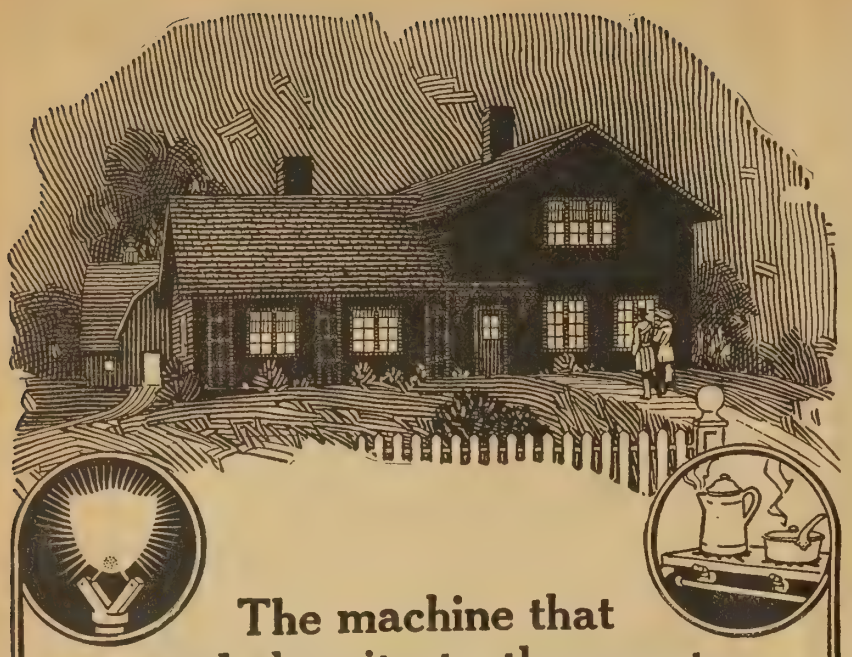
By the *CP* Pail Balancing Scale

Has two indicators. Weighs the milk in the pail. Eliminates errors. First hang the empty pail on the scale. Turn the thumbscrew in the center of the dial, which moves the red indicator until it is at the 0 mark, thus balancing the weight of the pail. Then add the milk or cream and the result shown by the red indicator gives the net weight of the milk or cream, and at the same time the black indicator gives the gross weight of pail and milk.

The capacity of these scales is 30, 60 and 120 pounds, according to size, in pounds and tenths of pounds. With each scale we furnish special blanks that will contain the record for two milkings a day for one week for 14 cows.

The scale can also be used for all weighing purposes.

Price each, 30 lbs. capacity by 1-20 lb. $4.85, 60-lb. $6.65, 120-lb. $8.85. Extra records per dozen, 15c.



Price each Postpaid (East of the Rockies)

The machine that moved the city to the country

JUST a simple little machine for mixing crushed stone and water to produce fuel and light. But what a machine! This marvelous mechanism is known as the Colt Carbide Lighting-and-Cooking Plant.

It brings carbide (crushed stone) in contact with plain, ordinary water automatically. The gas generated thereby makes the *hottest* cooking fuel known; it makes soft, mellow light that has been called "the chemical counterpart of actual sunlight."

You want this machine, because:

It will take the heat and drudgery out of the summer kitchen by substituting clean carbide-gas for sweltering coal and messy oil. It will put man-made sunlight in every room in the house, barns, outbuildings, drives.

It will give you every advantage of city cooking and lighting wherever you live, and at a cost so low as to be negligible.

There is no waste with a Colt plant. An automatic shut-off control suits the supply to the demand. The residue of the devitalized carbide is slaked lime, valuable for fertilizer or white-washing.

It is easy to install a Colt Machine. The only attention it asks is a small supply of carbide about once a month. And carbide is readily obtainable in every rural community.

Will you let us tell you the whole story of carbide lighting and cooking, as rendered by the simple little Colt machine? Just send us your name and address on a postcard. Take this first step today—without obligation.

Before You Decide on a Silo Investigate the

TECKTONIUS

BEST SILO ON EARTH

METHOD Of Silo Building

Wood Silos built by the TECKTONIUS METHOD have superior features found in no other silos. They are rigid, air-tight and are backed by a 5-year guarantee. Think of the advantages offered by the exclusive TECKTONIUS air-tight door that locks at all four corners, automatic adjusting hoop fasteners and super cable and base stave anchorage system.

A 5-Year Success

7000 Tecktonius Silos in Wisconsin alone. Thousands more giving perfect satisfaction in the United States, Canada and foreign countries. Endorsed by dairymen, and farmers everywhere. You too, can build a better silo than you can buy. Just follow our simple working plan. Use materials bought from your lumber dealer.

FREE Farm owners write today for our free book "Perfect Silage." Get the real facts about silos and full information about the original, exclusive TECKTONIUS METHOD. Also send name of your lumber dealer.

field has been thoroughly harrowed until it is in a fine state of pulverization the use of a roller will tend to pack the particles together and thus reduce the size of the space between them. This results not only in increasing the capillarity of the soil but in rendering it better able to conduct heat from the surface downward.

III. Temperature. The influence of soil temperature upon growing crops needs no emphasis, but the relation of certain factors to temperature deserves mention. We have just spoken of the poor conductivity of air and the need of small spaces between the soil particles. Generally speaking, soils warm up as the amount of either air or water is reduced while a rise in temperature is retarded by too much air or too much water. It is evident, however, that more water usually means less air and vice versa. A happy medium is the desirable state, since both air and water are highly necessary for productivity. Evaporation of water from soils is a cause of lower temperatures since this is always accompanied by loss of heat. Rapid loss of water by surface evaporation lowers the temperature from 5 to 10 degrees over what it might otherwise be. Hence the need for shallow cultivation to break up the crust that forms after a rain and to permit a surface layer of soil to be formed in which the air spaces are relatively large in size. The influence of humus also enters at this point. Humus it is that gives the dark color to most soils. Black has the physical property of absorbing more heat than other colors. Consequently a black soil will be relatively warmer during hours of sunshine than light colored soils, and will retain this heat further into the night. The heat absorbing powers of certain soil minerals also exert a strong influence of this kind. Sand, for instance, has high power of absorbing and transmitting heat. A soil in which considerable sand is a constituent will warm up quickly under the sun's rays but it will also give off this heat quickly after sunset.

Taken altogether, then, the productivity of soils is influenced greatly by both water and air quite independently of the matter of temperature. The relative amounts of water and air also govern temperature to a considerable extent as does the presence of humus and sand. In preparation of the seedbed and in cultivation these factors should be held in mind and influenced for good so far as lies within the power of the operator.

A Brick Cheese Factory

HOARD'S DAIRYMAN:—The Woodhull Co-operative Association, which operates a factory in Fond du Lac County for the making of Brick cheese, has just concluded a very successful year. The association paid off $1,000 on the outstanding debt and at the same time paid a dividend of 8 per cent. Enough new stock was subscribed at the annual meeting to clear all debts and provide a fund for improvements needed for a larger production during the coming year. The association handled 2,645,739 pounds of milk, and had a total make of 261,594 pounds of cheese. This sold for a total of $65,473.46, maintaining an average price of 25 cents per pound. A making commission of 2½ cents a pound was charged, and money received from the sale of whey cream totalled $4,017.04. The average price for butterfat was .656c and the average price for milk was $2.37 per cwt., returning to the farmers a total of $62,950.68. The average yield was 9.88 pounds of cheese per hundred pounds of milk.

PLANT FRUIT MAKE MONEY

This Valuable Book

Sent for 10 cents tells you how

HERE at last is a book on fruits that for the first time, tells you exactly what to do to insure success in fruit growing.

Tells it in an interesting, easy-to-understand way, just as if you were an old friend in whose success the author was vitally interested.

It gives you all the essential how, when and where facts, along with care and fare.

Sent for 10 cents by The American Association of Nurserymen.

Send for it at once to Secretary's Office:

Dairying Thirty Years Ago

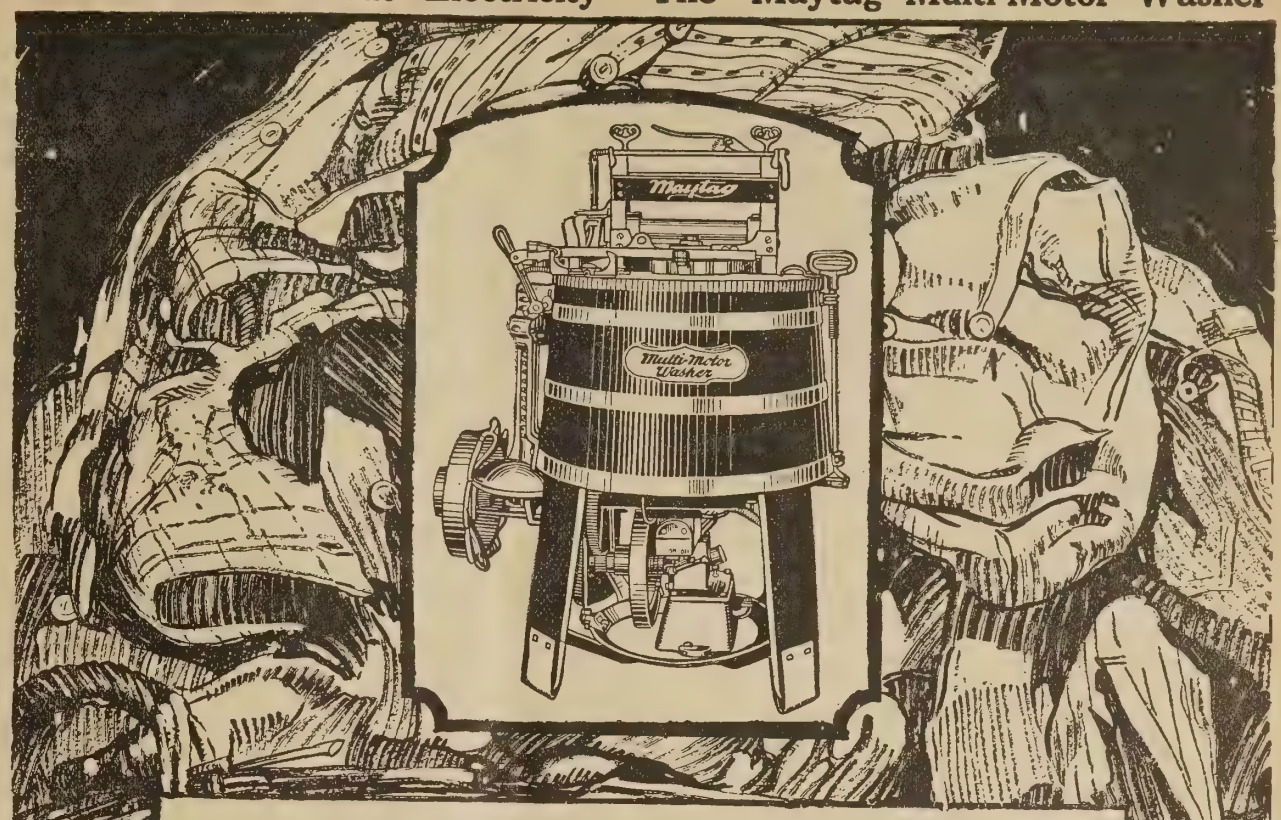
Taken from the Issue of March 13, 1891

C. L. Gabrilson thinks that feeding a young calf twice a day is better than three times. Brother Gabrilson ought to instruct his cows and sows that suckle their young, so that they will conform to his more *natural* method for bovine and porcine babies to take nourishment. Our own experience with calves is that until they are two months old, feeding three times a day is better tha. two, and four times even better than three. A baby stomach, the world over, requires frequent nourishment.

If the way your business is run will not stand the test of the severest financial scrutiny and the comparison with others in the same line, then you have something to learn about carrying it on. This is just as true of a dairy farm and of a butter and cheese factory as it is of a railroad, or a printing establishment, or a manufactory of any kind. Competition and supply fix the prices for sales. Reducing the cost of production is where the chance for exercising ingenuity and good judgment, integrity, and industry come into practical play.

The late Professor Fjord was recently instructed by the Danish government to make careful comparative trials between the different methods of separating cream from milk and making butter therefrom. After a series of trials extending over twelve months, Professor Fjord reported that to make one pound of butter it required with the separators twenty-four and four-tenths pounds of milk, while by the old fashioned system of skimming thirty-two and five-tenths pounds of milk were required, the difference being 34 per cent.

We have yet to find a woman who has proved a failure as a farmer. Nay, more, there are several ladies of our acquaintance who, as breeders of dairy cattle and practical managers of dairy farms, have proved their eminent fitness for such a business. As a rule, women are more painstaking and faithful to small details than men. The care of animals calls for a quick perception of a thousand and one important details which must not be neglected.



By carefully testing what a cow can do, prior to her being 4 years old, the farmer, if he finds she is not "panning out" much and is not likely to, can beef her while yet her flesh will make good butcher's meat and save the losses that would come from feeding her to an old age and raising her heifer calves to be as much of a failure as dairy cows as herself.

Dehorning Cattle

The advantages of dehorning cattle are set forth by D. G. Sullins of the Georgia Experiment Station in a recent press bulletin. He states that the only advantage of horns in a dairy herd is the added attractiveness of the animals which may be used for show purposes, that horns are responsible for many of the injuries in a herd and also that horns are very objectionable when cattle are brought together in herds, especially for shipment. Of special importance is his statement that dehorned cattle are more docile and make better use of their feed in the production of beef or milk than do animals with horns. Also, since such animals require less space in housing and may be fed and watered with less trouble, they require less labor in their care and management.

Dehorning with a saw or clipper is not recommended with animals which are less than one year of age, because of the chance that scurs will develop. This may happen with older cattle when the horns are not cut sufficiently close to the head, which should be about one-quarter of an inch below where the skin joins the horns, so that in dehorning a rim of skin is left on the horns removed. Mr. Sullins recommends the use of caustic potash on the young calf as the most satisfactory method of dehorning. To be successful, this caustic potash should be used before the calf is more than three days old. The hair should be clipped away from the small buttons which will be felt, and the stick of potash moistened and rubbed on the spots until the skin bleeds slightly. It is cautioned that care must be taken to make certain that not enough potash is used so that it will run down the calf's head. Where horns have been allowed to develop, dehorning should take place out of fly season and in cool weather. If it is done at other times, pine tar should be applied to the cuts. Care should be taken also that animals do not have access to straw piles or brush immediately after the horns are removed as they may harm themselves seriously by getting foreign matter into the wounds.

For Homes Without Electricity—The Maytag Multi-Motor Washer

The Power That Runs the Motor Car Does Your Washing

THIS Maytag Multi-Motor Washer is operated by a gasoline engine—the same kind of a power plant, in principle, that propels the speeding motor car—the powerful motor truck and tractor—the fleet airplane.

This remarkable little power plant is a part of the Maytag Multi-Motor—making this washer a real portable outfit. It isn't even dependent upon the length of a cord or position of an electric light socket.

On these March days you can wash in the cellar or kitchen or shed. A long, flexible pipe carries the exhaust outdoors. In hot summer weather you can wash on the cool porch or under some big tree where the breezes blow.

Handles anything any other power washer will handle. Costs little to own and to operate. Has a power wringer. You merely feed the clothes through. Any woman can run it. See local dealer or write us.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Coming Events

March 29-30—Cloverland Farmers' Institute will be held at Menominee County Agricultural School, Menominee, Mich. Superintendent, R. N. Kebler, Menominee, Mich.

May 23—Missouri State Holstein Association first Annual Show of Sale Cattle at Sedalia, Mo.

Missouri Holstein Meeting

An important meeting of dairy farmers was held at Clayton, Missouri, recently to discuss the organization of an eastern Missouri Holstein association. Action will be taken toward this end at a future meeting. Professor C. Larson of the Illinois Agricultural Association and A. C. Ragsdale of the University of Missouri spoke.

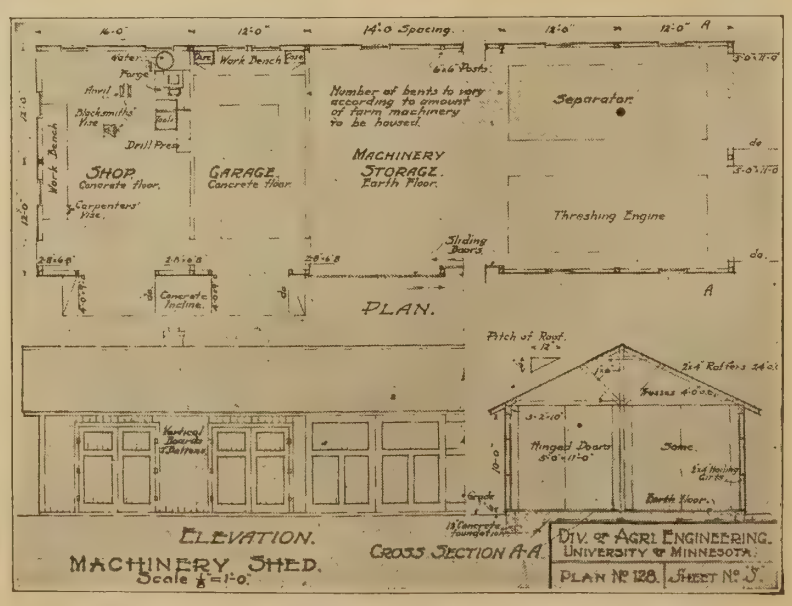
In part Professor Larson said: "Producers must have a dependable, stable market for milk at reasonable prices. The rural districts should have better living conditions. The profit of the dairyman is small, but there are two ways to better this—economical production and better marketing facilities. I would advocate the pooling of interests and the erection of receiving and manufacturing plants in convenient places, and the manufacture of butter and cheese of surplus products. Only by co-operation can milk producers obtain a constant and steady outlet for their product at a reasonable commensurate price. There are six large milk concerns in St. Louis who dictate the price on milk in that city. The 7,000 producers scattered over the state are not prepared to meet the buying power of these companies. The farmers demand a market that will bring just returns on their investment.

"The farm bureaus of the country will eventually solve the marketing system. Patience must be used to adjust and solve these problems. The farmer who pays $25 and $30 a ton for hay loses money on producing milk at $2.70, because it costs $2.69 to produce 100 lbs. of milk. Only by the complete organization of all milk producers can communities get results. Consumers are not so much concerned in the cost of milk, but the quality is what they want. Milk must be put before them in the proper light and the demand will increase.

"Dealers get 6 cents a quart for their milk and the producers less than 6 cents. Sour milk, etc., makes a percentage of 40 per cent loss to the producer, and only through organization can such conditions be made better for systematic marketing."

Professor Ragsdale said: "A large number of dairy farmers eat oleo and sell their butter. They should wake up and appreciate the value of their own product by consuming some of it themselves. A well-bred dairy herd does not necessarily mean pure blood or pedigreed stock, but the head of the herd should always come from high producing, pure-bred stock. Ensilage is absolutely necessary to produce milk economically and better feed and care of the herds should be exercised. The farmer is not justified in asking more for the milk until he betters the quality and production of his product. From a standpoint of profit a herd must be healthy and purely from a standpoint of dollars and cents every dairyman should have his cows tested. They must put clean, healthy milk on the market. There would be more sensible milk laws if dairymen had not allowed unsanitary conditions to exist, and they will not get justice until they take up the fight for clean milk."

A resolution was passed at the meeting that the dairymen of St. Louis County and St. Charles County should urge their state senators and representatives in the legislature to support a larger appropriation for the dairy department of the State Agricultural College. But $2,500 a year is now allowed for this work and the department is asking $11,800. A resolution was also passed asking the Chamber of Commerce of St. Louis to make an effort to secure a national dairy show for St. Louis.



A Machine Shed

Because the depreciation of farm machinery is a source of loss of which too little account is often taken, the division of farm engineering of the University of Minnesota has prepared two plans for farm implement sheds. One of these, No. 127, is designed especially for a threshing machine and separator. The other, No. 128, is a general implement shed and includes a work-shop and garage.

The plan for the general implement shed and shop as worked out by H. B. White, assistant professor of farm buildings, is shown in the accompanying drawing. The plan calls for a shed 24 feet from front to back and as long as the implement equipment of the farm makes necessary. The walls are ten feet high. At the extreme left is a work-shop with a carpenter's bench and vise, a forge, anvil, and blacksmith's vise, and a drill-press. The floor is to be of concrete. Adjoining this is a garage with a work bench and concrete floor also. To the right of the garage is the space for the storage of implements, the number of bents to vary according to the amount of farm machinery to be housed. The plan for this part of the shed calls for an earth floor. Access from the machinery storage room is had directly to the garage and through that to the work-shop. The doors to the work-shop and garage swing on hinges. Sliding doors are used for the storage room.

Mr. White believes in both permanence and attractiveness in a farm building of this kind and so urges the laying of a concrete foundation, and construction that combines attractiveness with utility. He further emphasizes the needed utility in urging that the machine shed on a farm should be on the line of travel between the barn and the fields.

Blue prints of the plans for both of these implement sheds may be had at the nominal cost of ten cents to cover the expense of making and mailing, by addressing the office of publications, University Farm, St. Paul. The same office has blue prints of houses, barns, granaries, a corn crib, hog houses, poultry houses, potato warehouses, and miscellaneous farm buildings and equipment together with plans for farmsteads which may be had upon the same terms. Before ordering any of these, however, farmers should write to the office for a list of the various plans in order that they may make selections from the description given. For example, there are 19 plans for farm houses of different sizes and styles on the list and to order simply a plan for a farm house makes it necessary for the office of publications to write for some description of the kind of farm house desired.—Minnesota College of Agriculture.

PLAN NO. 128 FOR GENERAL IMPLEMENT SHED AND INCLUDES A WORK SHOP AND GARAGE

Less Than a Thousand League Signers Cancelled

Every member of the Dairymen's League who signed the new co-operative contract, providing for the pooling of proceeds and the sale of his milk, was given in that contract from the 12th to the 28th of February to cancel it and withdraw from the Co-operative Association. The cancellation period is just past, and out of the 43,000 signers to the contract only 982 exercised their privilege of withdrawing and many of those who did withdraw did so for the perfectly good and legitimate reason that they were going out of the dairy business. Therefore in spite of all the money that has been spent and the propaganda written and spread throughout Dairymen's League territory to create in the farmers' minds distrust of the Co-operative Association and of the contract, only 2% withdrew their names.

What is of still greater interest in showing the spirit of the farmers toward co-operation is the fact that out of the 2,300 patrons of the co-operative plants which have been operated by the Co-operative Association for several months under the co-operative contract and with pooling of proceeds, only 169 cancelled. In other words, "The proof of the pudding is in the eating". The men who have worked under the co-operative contract during the past eight or nine months, about the worst period for the marketing of milk for the past ten years, were well enough pleased with the work of their own association to stick to it.

The meeting of the directors on March 17th will be followed by county meetings in over seventy counties where the League is organized, and at these county meetings plans will be made for committees to visit every dairyman on his farm to give him a chance to participate in the benefits of co-operation. E. R. EASTMAN.

Seitz Premier Breeder

The Ayrshire Breeders' Association announces that at the last meeting of the Executive Committee of the Association it was ruled the yearling bull, Wendover's Ambassador, was bred by F. S. Peer of New Jersey, and not by Wendover Farm of that state. This decision gives the banner for premier breeder at the 1920 National Dairy Show to Adam Seitz of Wisconsin.

Soil Inoculation For Legumes

Inoculation for one legume crop will not necessarily serve for all legumes. If one legume crop has been grown on a soil and was thoroughly inoculated with many nodules on its roots, this gives no assurance that any other kind of legume will grow without the special treatment of inoculation. Some different kinds of legumes inoculate each other, but legumes do not cross-inoculate universally. Some have a single kind of bacteria which will grow on no other plant, and they must be inoculated with that specific kind of bacteria for their best growth, while others have one kind of bacteria common to two or more types of plants. It is a well established fact that alfalfa can be inoculated with the bacteria from sweet clover, and that the cowpea may be cross-inoculated with the wild partridge pea. Likewise, red clover, white clover, and all other true clovers will inoculate each other. Soy beans, however, have a particular kind of bacteria not yet found on any other legume. According as the common legumes will cross-inoculate, or as they have the same kind of bacteria in common, they may be separated into the following groups:

1. The true clovers, including red, white, alsike, crimson, and mammoth red.
2. Alfalfa, yellow and white sweet clovers, bur clover, and black medic or yellow trefoil.
3. Cowpea, partridge pea, peanut, velvet bean, and Japan clover.
4. Garden, field and sweet peas, and vetches.
5. Garden beans.
6. Soy beans.

Because sweet clover and alfalfa inoculate each other many persons are apt to think that simply seeding sweet clover will inoculate the soil for alfalfa. Such is not the case. If proper bacteria have never been introduced artificially or by chance, they must be applied when the first of these two crops on the soil is sweet clover as well as when it is alfalfa. Sweet clover often gets into alfalfa and smothers it, because conditions favorable for alfalfa are also favorable for sweet clover. The bacteria that nourish the alfalfa also nourish the sweet clover, and the sweet clover makes a much more rank growth, so that the alfalfa is smothered out. The soil is, however, no better supplied naturally with the bacteria for sweet clover than it is with those for alfalfa the first time one of these crops is grown; and if they must be added to the soil for the alfalfa, the need of inoculation cannot be met by substituting sweet clover. If the soil is to be put into alfalfa eventually, there may be some advantages in first seeding it to sweet clover for a season or two, since the latter crop seems to be less delicate than alfalfa. It establishes itself over weeds more readily and helps distribute the bacteria for the alfalfa. It cannot, however, generate the bacteria needed for the alfalfa if they are not put there either by chance or by artificial inoculation, and the venture of establishing inoculation for sweet clover is as great as establishing it for alfalfa.

Soil may be inoculated by two methods: (1) By transferring soil from a field where the same legume has been growing with plenty of nodules, and (2) by the use of pure cultures, or artificial cultures, grown especially for this purpose.

The Soil Method

The use of inoculated soil was the first means of introducing the proper legume bacteria into a field, and this was accompanied with such good results that it has become established as good procedure. By this method, from 300 to 500 lbs. of inoculated soil are scattered over each acre of the field and disked or harrowed in before seeding. The soil so distributed is collected from the surface six inches of a field on which the same legume—or one which cross inoculates with it—has been grown recently with many nodules. Extensive exposure of this soil to the sun before scattering is thought to be detrimental to the bacteria, but definite evidence fails to prove that this is as harmful as might be thought. Useless exposure to the sun, however, should be avoided.

In case only small amounts of soil are available it may be applied to the seed rather than to the field. Soil collected as just mentioned is dried and sifted over the seed which has been moistened (not wet) with a ten per cent glue solution (one pound of liquid furniture glue to one gallon of water, or one pound of dry glue to three gallons of water). Dry, powdered soil is added while the moist seed is stirred until every grain has become coated and the seed has a dirty appearance. After drying rapidly to prevent molding and loss of vitality, the seed is ready to be sown. The smaller seeds, such as alfalfa and sweet clover, will need to be screened before seeding in order to break up the clusters of seeds held together by the glue.

Some objections have been made to the soil inoculation method, but under proper precautions the objections are not serious. The method may be laborious, and rather expensive when no thoroughly infected soil is available in the immediate vicinity. It can also introduce noxious weed seeds or dangerous plant diseases, but these can be avoided by using unifested soil. When any of these undesirable conditions prevail, the pure-culture method might well be used; but whenever good soil can be had for the same cost as pure cultures, the soil method is doubtless preferable. It has given a greater degree of success in past experience.

Pure or Artificial Cultures

The pure-culture method, like the soil method, is based on the principle of scattering the bacteria on the field. The bacteria are grown especially for such use. When bacteria were discovered to be the cause of the nitrogen-gathering power of legumes, attempts were soon made to grow pure cultures of them to avoid the difficulties of the soil method. For several years the pure cultures were in ill repute, but recently improved methods of propagation and distribution have overcome the former opposition and tests of commercial cultures by many experiment stations have found them generally reliable.

The desired bacteria are separated from the nodule and grown on neutral jelly in the laboratory, where they increase rapidly. These are sent to the farmer in various ways, sometimes in solution, sometimes on vegetable jelly, but more often on sterilized soil or sand. The method used is immaterial, provided the bacteria are alive. In using the culture it is diluted with water, sprinkled on the seed and allowed to dry.

The advantages of this method are its simplicity and ease of performance. No great expense is involved in making the cultures. With pure cultures there is no liability of introducing dangerous diseases, destructive insects, or noxious weed seeds. They must not be used carelessly, however, since the bacteria are living organisms and die when the cultures are stored too long or subjected to excessive heat or cold. Directions for using are always supplied and, if followed with reasonable care, this method of inoculation should be successful.

Small Acreages for Beginners

Whenever a new legume is seeded for the first time it is good policy to attempt it on a small acreage. Such procedure offers a chance to become acquainted with the habits of the crop and the best methods of handling it, without the chance of a heavy loss of money and labor in case of failure. If this small area is inoculated, soil may be taken from it to inoculate larger fields in years following. It is, however, well to leave a part of this small area uninoculated and if the treated part has dark green plants with many nodules on the roots while the untreated has poorer plants or fails to develop nodules, the soil needs inoculation for the crop.

Such procedure with the small acreage of a new legume has the following advantages: First, it involves no great risk of a heavy loss in labor and money; second, it determines at a very small cost whether the legume crop will do well; third, it tests the soil to see if inoculation is necessary; and fourth, if such treatment is necessary, it furnishes the soil from the inoculated part of the field as good material for inoculating the rest of the farm. Venturing on a small scale is far better policy than trying a large one, and anyone who is seeding a new legume for the first time will do well to be guided by this principle, trying a few acres to find out how successful the crop is in the locality, rather than investing large sums in seed and labor to be lost in possible crop failure.—W. A. ALRECHT in Missouri Circular 86.

BESSIE OF OAKLAWN FARM, A GUERNSEY COW OWNED BY GEO. H. VANDRE OF WISCONSIN

In December she produced 100.2 lbs. fat; in January 85 lbs.; in February, 98.3 lbs.; and for March, 101.9 lbs.; an average for four months of 96.4 lbs. In this time she averaged 2,142 lbs. of milk per month.

A Splendid Food Product

One of the many splendid dishes that can be made from milk is junket, a very nutritious food product, the composition of which is milk, sugar, and flavoring. Junket is a very delicious dish and oftentimes is looked upon as a dessert or a pudding because it is highly flavored and sweetened, and in a solid form.

Junket is made by adding to the whole milk any flavoring desired, together with sugar and a junket tablet, which when allowed to stand causes the milk to turn into a solid.

Numerous flavors can be used such as strawberry, vanilla, raspberry, orange, chocolate, and various others.

There is no reason why the public should not use vastly more junket than at the present time. It is possibly because they have not received the information regarding this valuable dish. There is nothing so good for all the family as the milk foods.

Junket is put up in two forms, tablets and powder, each convenient for a variety of uses.

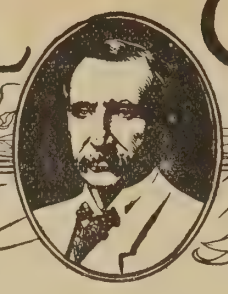
Junket tablets are used with lukewarm milk which must be sweetened and flavored to taste for desserts and ice cream. The tablets are also used for making cottage and cream cheese, whey for invalids, and for modifying milk for infants.

Junket powder comes with flavor and sugar, all ready to be added to the lukewarm milk. It makes excellent quick milk desserts and delicious ice cream. One package is generally used to a quart of milk.

A greater use of this excellent food would mean better health and a saving of money. Why not get acquainted with this delicious dish; and remember milk foods are the best foods there are.—NATIONAL DAIRY COUNCIL.

Canadian National Ayrshire Sale

On March 24th Canada holds her first National Ayrshire Sale. This follows the annual meeting at Montreal and promises to be one of the the best Ayrshire sales ever held in Canada. Forty head of carefully selected animals are being sold. These have successfully passed the combination tuberculin test or will be sold subject to a sixty-day retest.



At the annual meeting on March 23rd, changes in the by-laws of the association will be considered, one to provide that $1.00 of the member's fee shall be applied as an annual subscription to the Canadian Ayrshire Review, and another providing that when a director holds office consecutively four years he automatically retires and is not eligible for re-election for two years. Another matter for the approval of the association is a proposed reciprocal arrangement between the Ayrshire associations of the United States and of Canada by which animals recorded in the herd book of either association will be accepted by the other without the recording of ancestors.

Ayrshire Association Organized in Pennsylvania

The Ayrshire breeders of McKean County, Pennsylvania, on February 14, 1921, organized the McKean County Ayrshire Breeders' Association, their constitution and by-laws embodying such clauses as "to become a member one must place his herd under the state and federal supervision for the eradication of tuberculosis" and "any member wilfully misrepresenting a pure-bred, for the purpose of a sale, will upon sufficient evidence be expelled from the association". The number of reactors in the county have been .8 of 1%. This exceptionally low percentage, an ideal dairying section, well-bred heifers and bulls, together with the enthusiasm shown, will truly make history for the Ayrshires.

Pennsylvania. W. W. SMITH.

EDITORIAL COMMENT

THE Wisconsin Division of Markets has made the following statement: "The farmers want to have something to say both about local and terminal conditions. Their ambition is to build up a system which will enable farmers to control their products more than they have in the past. Farmers are opposed to a system in which farm products pass into other people's hands at low prices only to be held until needed by consumers and then sold at much higher prices."

We wonder just how many farmers are really concerned about the marketing of their products. Those willing to devote some time, willing to make some sacrifice for the improvement of marketing their products, are the only ones really interested in establishing an improved system of marketing farm commodities. Altogether too few men are really interested in this subject. Every farmer is interested in receiving a high price for his products but so few are sufficiently interested in improving the marketing system that it is discouraging to those who see the necessity and opportunity for providing better methods for selling farm products.

THE SOIL

Despised earth, thy blackness is a shroud
For struggling hosts that perished in the past,
That man might till a soil with life endowed
And garner wealth that centuries amassed.

Holy earth, man's sacred heritage
To use in trust for ages more sublime.
May I not, then, commit the sacrilege
Of wasting from their fields the gifts of time?
—NIMROD.

These verses are full of meaning. They describe briefly how the soil has been enriched and man's sacred duty toward the soil.

The earth is holy. It is a sacred heritage of those who occupy the land whose duty is to hold it in trust for the coming generations.

All thinking men appreciate their duty to the soil and that its fertility belongs to the coming ages as much as it does to the present. They have urged that the fertility of the fields, which is the gift of time, be conserved and that to waste it is to cheat the future generations. To treat the soil intelligently requires a knowledge of it, the character of crops to grow, and how it must be fed. The men who have seen their duty toward the soil and toward the coming generations have become true farmers and splendid citizens.

HOME OR MONEY

There are those who complain about the money return of the farm, and consider that the professions offer a much larger remuneration. Those who consider the professional career superior to the calling of farming do not know its difficulties as they do those of the farm, and altogether too frequently do we find persons who have not comprehended the real purpose of life. The resignation of Professor A. D. Wilson, chief of the Extension Department of the Minnesota College of Agriculture, that he may take charge of his farm in Northern Minnesota, has led us to consider the object of human activities. Mr. Wilson was farm bred and reared. He knows farming and he likes it. His salary has been above the average of those engaged in teaching agriculture; yet he gives up this position that he may build a farm home, a desire he has always expressed. He appreciates the money return may be less, but success is not measured in dollars and cents alone. The farmer may not have opportunity to handle so much money as the man engaged in some profession, but a farm properly managed gives greater opportunity for building an ideal home and preparing a competency for old age.

After all, isn't it one of the main purposes of life to be engaged in a work that is to our liking? Isn't the building of a home our most important work? The building of character is the greatest purpose of life, and without a home, with wholesome surroundings, this purpose is not so easily attained; in fact, too much money often brings defeat. There is no question but that we as a people dwell too much upon the getting of money and not enough upon what should be the real purpose of human endeavor. No other home is quite so well situated as the farm home, and Mr. Wilson appreciates this. His taste for rural life and its work has led him to decide to build his future home in the country where he can rear his family in useful service and surround them with the best conditions for the development of character.

SHOWS AND TUBERCULOSIS

We have been informed, upon good authority, that a herd of well bred dairy cattle which was exhibited at several fairs and at the Dairy Cattle Congress and at the National Dairy Show has had ninety per cent of its members react to the tuberculin test. These animals at the beginning of the show circuit were free from tuberculosis, but five months afterward ninety per cent of them were suffering from this disease. This is a serious matter.

The public desires to see the best bred animals and it is of advantage to the advancement of our live stock industry to exhibit them. The breeder who has clean cattle at home cannot afford to expose them to diseased animals, and after having an experience which causes him to lose ninety per cent of his show herd is not likely to show any of his cattle again.

Managers of cattle expositions have a responsibility which should cause them deep concern, for, unless they act with decision and enforce rules which will prevent the exhibition of diseased cattle, our fairs and dairy shows in the future will suffer. There is a general awakening everywhere to eliminate tuberculosis among cattle and the best breeding herds in the country are being placed upon the tuberculosis-free accredited list. None of the owners will show their cattle in the future unless they are sure that the management of fairs and dairy shows has taken steps to prevent without doubt the entrance of any tuberculous cattle.

We suggest that those who have the management of fairs and live stock expositions in charge and the breeders who desire to show cattle put forth extra effort this coming show season to see that nothing but healthy animals are permitted to be exhibited. It would not be going too far to require that the herd from which the show cattle are selected is free from tuberculosis. Any herd found to contain diseased cattle should not be permitted to exhibit any of its members even though the exhibition animals were shown by the tuberculin test to be free from tuberculosis. Tuberculous germs are likely to be lurking in show animals from such a herd and they might spread contagion.

HUBAM CLOVER

"Hubam clover" is a new name for the recently popularized annual white sweet clover which was found by the Iowa Experiment Station in 1916 and which has since been distributed to many sections of the United States. The choice of this name is made for the purpose of doing away with any confusion with the biennial white sweet clover and also to shorten the name in order to make it more appropriate for every-day use.

Hubam clover, as it is now to be called, was first found by Professor Hughes in an experimental seeding that he had made in the greenhouses at Ames. He carefully saved the seeds of the few annual plants he discovered and has since grown the seed in increasing amounts and has distributed it until fairly large amounts have been grown. Various reports have been circulated that this annual sweet clover had been found growing in other sections of the United States but when finally traced down by Professor Hughes, he was convinced that the first mutation which produced this particular clover probably occurred in a certain section of Alabama not over 30 years ago. It was not recognized as a new clover because it was mixed with the regular biennial clover. There is now an attempt being made to capitalize this later information and there is some danger that there will be a considerable portion of the common sweet clover seed being put on the market at the price now prevailing for the annual seed.

The Michigan Farm Bureau Federation has purchased some 40 bushels of seed of Hubam clover which it will distribute to Michigan farmers as rapidly as possible. The Iowa Experiment Station will also continue the practice it has previously adopted of sending a small sample of this seed to every inquirer who will send a self-addressed stamped envelope to the Farm Crops Section, Ames, Iowa.

THE VALUE OF GREEN FEEDS

Investigational work done by Professor E. B. Hart and his associates at the Wisconsin College of Agriculture indicates that the fresh, green plant has in it a certain property that is extremely valuable for the best nutrition of the animal and for the largest possible production of milk. While their work has been largely confined to experiments with milch goats, there seems no reason why it should not be applied to dairy cows as well.

In some previous work which they have done, they found that milking animals, such as the cow and goat, would excrete more calcium in their milk and feces than they received when being fed on grains and dry oat straw. In the case of a goat, they found after a period of this type of feeding that if they fed the animal fresh green grass, almost immediately the goat would discontinue throwing off more calcium than was supplied in its food.

The particular point in this experimental work is that it is the belief of many men that it is the failure to assimilate sufficient calcium that frequently brings our milk cows down in production. This is particularly true of the period just prior to freshening and this decreased production seems to continue throughout the entire succeeding lactation.

The particular factor that is found in green growing plants is possibly similar to the fat soluble A which is the factor in milk which makes it desirable for growing children. Neither of these factors are discernible by chemical test and are only shown by feeding trial. Investigators have found that the principle of green grass which is so valuable in the assimilation of calcium and lime is also found in other green growing plants and also seems to be found in considerable quantities in such roots as turnips and rutabagas. For some reason it does not appear to be quite as good in silage, indicating that the heating and fermentation may have destroyed this particular principle. This factor is also found in the juice of such fruits as oranges. It is too early as yet to make any definite application of these investigations but it opens up a line of new study which may prove highly valuable to the dairy industry.

TOO MUCH BUSINESS

At this time when the dairy cattle business, in common with most other lines of business, has been experiencing a slump, it comes as somewhat of a surprise to learn of a breed association that has too much business.

Recently a county breeders' association, that had been advertising their county as a center where good cattle could be purchased, discontinued its advertising because their secretary's office was unable to answer the resulting inquiries. This is, of course, decidedly poor business to neglect such inquiries and the advertiser who does so regularly

is much better off not to advertise. In this case discontinuance of the advertising did not seem to be the right remedy.

The primary purpose of a county breeders' association is to serve the interests of the breed it represents and to improve the sales of the breeders who are members. In this particular instance the association represents a well established Holstein county, one that has good cattle for sale and one where suitable advertising is warranted. The membership realized this and voted the necessary appropriation for such advertising. Consequently the association is falling short of its purpose; it is not adequately serving its members. Suitable provision should be made to handle business. The secretary is unable to do it because of his own business but it is possible to hire some one to do it and, furthermore, it would certainly pay to do so.

This is a problem that every growing, local association will have to meet sooner or later. Some one must do the work connected with a secretary's office and as the association grows it is asking too much to expect a breeder or business man to give his time gratis to the work.

Large county associations in Wisconsin and elsewhere are beginning to employ paid secretaries, paying them in various ways. There is no rule that will apply to all but it would be well for very many associations that are expanding rapidly to avoid delay in considering this question. It will not pay them to wait until the emergency arrives before beginning to prepare.

The inquiries which come to this county show the confidence these men have in the dairy industry and their desire for well bred cows. It is unfortunate that this county failed to serve them promptly. This incident shows that breeders who have good cattle and advertise them properly and employ good salesmanship need have little fear of finding a good market.

Soilage and Soiling Crops

I have a small herd of Jersey cows, amounting to ten in number, and I find, in trying to rotate crops, that I have nothing like enough pasture.

I know that in the old countries the farms are very small and I thought probably you would have some information on how to raise green crops for feeding a herd instead of pasturing them. Is that not done by some of the large dairies, and is it not practical?

Columbus, O. C. L. C.

If there is sufficient labor to properly handle and cultivate all the land, it will be found more profitable to follow the system of soilage than to attempt to pasture productive, tillable land. By soilage is meant the growing of a succession of green crops and feeding continuously during the summer months, or the making of silage so that the cows may receive the regular silage ration during twelve months of the year. In a general way it is estimated that it takes three acres of good pasture to supply a cow with as much feed as can be obtained by cultivating one acre and harvesting the crop either as soilage or silage.

Compared with allowing animals to gather their feed by grazing, Professor Henry in his book on "Feeds and Feeding" states that soilage has the following advantages:

"1. With all crops, even grasses, which soon spring up again when grazed, a larger yield is secured by allowing the plants to nearly mature before harvesting than by pasturing them. 2. With a properly planned succession of soiling crops an abundance of palatable feed may usually be supplied throughout the season, so that the production of the animals will not decline if pastures become parched in midsummer. 3. None of the forage is wasted through being tramped down by the animals or fouled with manure. 4. Less fencing is required. 5. In bad weather cattle will be more comfortable fed soiling crops in the stable than when grazing."

The disadvantage of soilage is the greater expenditure for labor, feed, and fertilizer in producing the crops and for labor in cutting and carrying them to the animals. Also, in warm weather the soilage crops are liable to ferment and spoil if cut in too large quantities for immediate feeding. It is also difficult under this system to always have a proper succession of green crops that will be in the best condition.

The largest objection to soilage is overcome by use of the summer silo. Such a silo should not be so large in diameter but that at least two inches, or preferably three inches, will be fed off each day. If a less quantity is fed the silage is quite certain to mold and spoil, thus making an actual loss of the feed or producing an indifferent and dangerous feed.

Most successful dairymen follow a combined pasture and soilage system, in most cases using summer silage to supplement pature when the latter does not furnish sufficient feed. To provide a succession of green feed by means of soilage crops it is necessary to fit and plant comparatively small areas to the different crops at different times. These crops must be harvested in small quantities and in all kinds of weather, which is both inconvenient and expensive, besides which the work must be done during the busiest season of the year. This objection does not hold true where corn or sorghum are grown for silage, for with these latter crops large fields are fitted, planted, cultivated, and harvested with labor saving machinery and at a minimum of expense. Also the labor involved in feeding the silage takes but a few minutes daily during the summer season when the fields are demanding the utmost exertion of the farmer.

Another reason why silage is preferred is that corn and sorghum will yield more feed per acre than any of these soiling crops. In discussing this particular phase of the question, Professor Henry further states: "Silage furnishes feed of uniformly high quality throughout the season, a goal which is difficult to attain by soiling, for one crop is often exhausted or too mature before the next is in prime condition for feeding. The years when drought is severe and pasture unusually short are the very times when soiling crops will be scant or may even fail. By means of the silo the crop may be carried over from one year to the next, thus providing insurance against drought."

The accompanying table of soiling crops represents the practice followed at the Iowa Experiment Station, which was found very desirable.

Succession of Soiling Crops Used

Approximate time of cutting	Crops	Approximate time of sowing	Rate of seeding per acre	Av. yield of green feed per acre
June 10—June 15—	Alfalfa	Spring or August	20 lbs.	6 tons
June 15 July 5	Oats and Canada field peas	April 5	1½ bu. oats 1½ bu. peas	5 tons
July 1—July 10	Oats and Canada field peas	April 20	1½ bu. peas 1½ bu. oats	5 tons
July 10—July 15	Alfalfa	Spring or August	20 lbs.	3 tons
July 10—July 20	Amber and fodder cane	May 5	70 lbs.	20 tons
July 15—Aug. 15	Fodder cane and cowpeas	May 15	30 lbs. cane 1 bu. cowpeas	11 tons
Aug. 15—Sept. 20	Fodder cane and cowpeas	June 10	30 lbs. cane 1 bu. cowpeas	14 tons
Sept. 20 to heavy frost	Millet	July 10	3 pecks	3 tons

Where a field furnished more feed than was used in soiling and the crop, perhaps, was getting too ripe, the balance was cured as hay or made into silage. In this manner there was no direct wastage of the crop.

Under average conditions and given a good soil, it will take approximately three-quarters of an acre per cow of soiling crops for the usual summer season. In many cases two crops may be grown on the same field if care is exercised.

Remodeling Cow Barn

I would like to remodel my cow barn from a 30-cow to a 15-cow barn. The dimensions are 33'x60' inside; feed alley in center is 12'x60'; cow stalls and gangs are 10½'x60' each. Do you think that this 10½'x60' is large enough for exercising pens for 15 cows? I want to change this space into maternity pens and calf pens. How would you divide this space for best economic results? How would you arrange for feed and water in these pens?

I want to divide a 11'x20' space in another part of barn into a bull and breeding pen or crate. How would you go about this?

Oregon City, Ore. G. B.

As we understand it, you propose to remove the cow stalls from one side of the barn and replace them with maternity and calf pens; however, your question, "Do you think this 10½'x60' is large enough for exercise pens for 15 cows?" misleads us somewhat. We assume that you simply asked this question with another idea in mind. Fifteen cows can be placed in this space and they will have sufficient room to move about quite freely.

The space can be divided into four maternity pens 9x10½', and two calf or young stock pens 9½x10½' with a 5 ft. feeding space between the two calf pens. The calf pens will accommodate six small calves or four young stock in each pen; all pens to have a gate for entering from the center feed alley; the cow pens to have a feed box or manger on the side next to the feed alley. For watering, an iron cup or bowl in each pen connected up with piping to an overhead supply tank or some other pressure system is recommended. A system of this kind is a labor saver and permits the animals to drink at any time they desire. Steel maternity and calf pens are preferable to wooden construction as they are more durable, sanitary, permit better lighting and ventilation, and present a more pleasing appearance.

For prices of water cups and steel pens, we suggest that you write to the firms advertising barn equipment in these columns; they are in a position to give you some valuable suggestions for rearranging your barn to get the most economical and efficient results.

In order to give suggestions of any value for constructing the bull pen and breeding crate, more detailed information concerning this space and its surroundings would be necessary. If the space required for a breeding crate is taken off, it will reduce the size of the bull pen considerably. It is suggested that, if possible, the breeding crate be placed outside of the building and gates arranged so that the bull can be allowed to enter the crate or be shut out as desired.

Wisconsin. A. G. CRERAR.

Silage Heats and Molds

Can you explain why ensilage sometimes will be hot and steamy? I built a new silo last year and my silage was hot all winter. The nearer I got to the bottom, the hotter it got. This winter, it is the same way only not quite so hot. It gradually gets cooler as I near the bottom of the silo.

My silo is a 10-foot diameter Bourbon triple wall and I am feeding only nine head of cattle and have experienced a considerable trouble and loss of silage on account of not being able to feed it down fast enough. Of course, when silage is warm and steamy, it spoils very quickly. My neighbors do not seem to have any trouble with their silage in this way. I have examined the silage in several silos in this vicinity and find it perfectly cold in every case.

I put in the mammoth Eureka corn and it was pretty well dented when ensiled but the leaves were all green. I do not have a cement bottom in my silo; I am just using the ground for a bottom. Do you think this is all right? Do you think that the heat is caused by not enough moisture in the corn at time of ensiling?

Batavia, Mich. C. L.

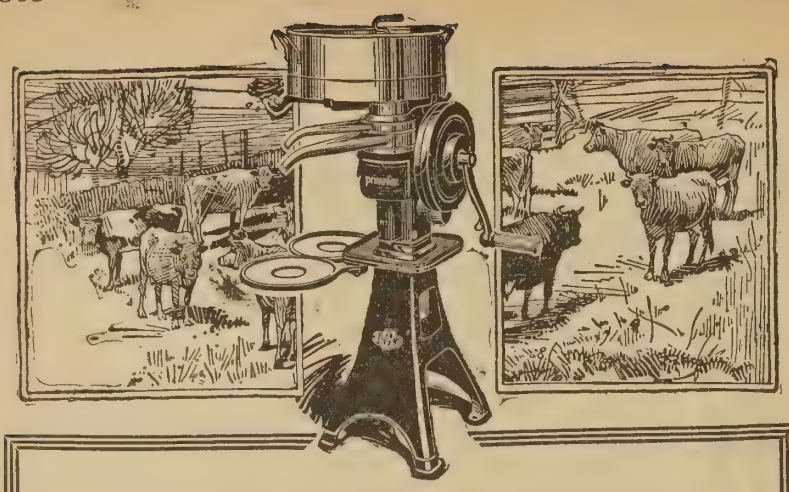
Heating of silage indicates the presence of air. The corn probably was too dry when put in the silo. If water was added the amount was insufficient. Poor packing may be the cause of the air getting in and the fact that the silage is better towards the bottom suggests this especially. There is always more danger of poor packing in a silo ten feet in diameter than in a larger one.

It is advisable to feed off at least two inches daily to insure good keeping quality and with nine animals to feed you are probably not feeding hardly this much. A two-inch layer would weigh about 425 pounds.

Silage will keep all right with a dirt floor and this is not the cause of the trouble. A cement floor, however, is advisable. Try covering part of the surface of the silage with canvas or building paper, removing this when taking out the daily supply to feed. C. H. ECKLES.

Minnesota College of Agriculture.

Pearl Pop-corn for Silage



I am advised that pearl pop-corn makes an excellent silage. Do you find that it is better than the ordinary field corn?

If you advise the pearl pop-corn, will you kindly inform me how the same is planted? Do you drill it in with a grain drill, or with the corn planter, and what width apart?

Peoria, Ill. G. J. J.

We see no advantage in the use of pearl pop-corn for silage. There is no question but that it should prove a good silage but it is doubtful whether it will yield as much silage per acre as will that of other varieties which are usual in this section. The field corn which will mature ears and at the same time make the largest growth of leaf and stalk is probably the best variety for silage purposes.

If it is desired to use the pop-corn, we would seed it in the same manner as corn is seeded for silage purposes. If the field is fairly free of weeds, we would suggest drilling it in with the corn planter, placing the plants or seed from 6 to 12 inches apart in rows, the rows being the usual distance apart.

A Better Farm Every Year

As soon as a high grade cream separator finds its place on a farm it starts a whole train of better conditions. Cream profits mount one-fourth to one-third. Warm skimmilk fed to calves and pigs makes sturdy animals that develop early. The fertility of the soil is kept up to the maximum, and the farm as well as the herd increases in value every year.

We contend that evidence shows the *Primrose Cream Separator* will bring about these results *more surely* for you than any other separator. Once it is installed the question of getting the full value out of everything you sell is much nearer settlement.

In addition to assisting you to get the top price for everything you sell, Primrose gives you an extra feeling of security because Primrose has a true record for quality, for durability, and for close skimming. It is free from mechanical worries, it turns easily, is easy to wash, and it requires only an occasional oiling. Cleaning out the oil reservoir—a big chore on other separators—is unknown with the Primrose because dirty oil is drained out every time new oil is added.

There are a dozen other things you will like about the Primrose. Go and see your nearest International dealer and let him explain them, or write for catalog. Ask for information about the new electric motor driven Primrose and the new direct power drive.

DAIRY MARKET NEWS

Cheese Markets Quieter

[Report by U. S. Bureau of Markets.]

The cheese market during the week ending March 5 ruled steady. Trading consisted mostly of small lots of average quality, dealers holding their better grades for prices somewhat above prevailing quotations. With comparatively lower prices in the eastern markets, demand from the Middle West increased causing an active market in New York State and a decrease in general stocks, especially of such styles and grades as were included in heavy purchases made by western dealers and users.

Toward the close of the week, trading at Wisconsin primary markets was reported dull and weaker. Orders slowed up, and an easier tone was noted, although the demand was very good for small lots, and limited for carlot shipments. The arrival of several shipments of Twins at Chicago from eastern points has depressed the market for this style.

New Style Cheese at New York

A small 5-lb. cheese about 2½ in. square and 13 to 15 in. long, called sandwich cheese, has gained favor on the New York market, and is preferred by some of the trade formerly using Young Americas. This cheese weighs about 5 lbs., and 4 or 5 are packed in a box.

Plymouth Market Changes Little

Sales on the cheese board at Plymouth, Wis., on March 7th, were made at the same prices as last week except Longhorns which advanced 1c and Square Prints which dropped ⅜c. The following quotations were established: Twins 26c, Daisies 26½c, Longhorns 26c, Young Americas 24c, and Square Prints 27c. Prices on Feb. 7th were: Twins 23⅓c, Daisies 24¼c, Double Daisies 23½c, Longhorns 25¼c, Young Americas 25c, and Square Prints 24c.

The average wholesale prices on American cheese (style Twins) for the week ending March 5, 1921, and for the corresponding week a year ago were as follows:

	Week ending March 5 1921	1920
	cents	cents
New York	27.7	29.2
Chicago	26.9	26.6
Boston	24.7	31.1
San Francisco	20.7	30.0
Wisconsin	26.7	26.8

The total receipts of American cheese at these markets were 2,748,757 lbs. as compared with 3,220,158 for the corresponding week a year ago and 2,835,584 lbs. last week.

Recent Price Advances Checked on Butter Markets

[Report by U. S. Bureau of Markets.]

After registering an almost continuous advance in price averaging more than 10c for top grades on the four markets since Feb. 10, the butter market became topheavy and reacted during the week ending March 5. There was a certain amount of skepticism the previous week, many members of the trade thinking that prices were becoming too high, but New York seemed to be short of fresh butter and buyers were stocking up heavily in order to anticipate any further advance. A certain amount of momentum goes with either a continued advance or a continued decline and this factor held up the market until Wednesday, when buying stopped and declines were in order the rest of the week.

The statement is often heard that a market cannot go one way all the time and traders were of the opinion that with less quality storage butter to choose from and with no reason to expect any large increase in the fresh make, the market would soon settle at a price somewhere around 50c. This would mean a retail price under 60c, which is considered consistent with the maintenance of normal consumption. More Danish is expected and with the shortage in the Northwest evidently taken care of, judging from the 15c drop in the San Francisco market, more Pacific Coast butter may come to eastern markets.

A few weeks ago butter was scarce on the Chicago market while New York reported a surplus. Chicago now has a number of cars of centralized butter and more surplus on the street, while New York has only a slight accumulation resulting from the break in prices.

The cargo of 11,200 casks of Danish butter on the steamer Heligolav is expected to be available about March 14th and other small cargoes, including those on the Stockholm and Magnolia are either in or due shortly. This butter is now costing between 44c and 45½c C. I. F.

Considerable difference of tone was apparent on Saturday's closing market. New York firmed up with ½c advance, while Chicago made a further break of 2c on 92 score and of 4½c on centralized carlots. The decline under Monday's prices amounted by Friday to ½c at New York and Boston, 3½c at Chicago, and 1c at Philadelphia.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending March 5, 1921, and the corresponding week last year were as follows:

	Week ending March 5 1921	1920
	cents	cents
New York	53.4	63.9
Chicago	51.9	64.2
Philadelphia	54.0	64.5
Boston	53.1	65.5
San Francisco	41.9	57.4

The receipts of butter at these markets were 7,543,708 lbs. as compared with 7,384,663 lbs. last year and 6,475,090 lbs. last week.

New York Butter Market

New York City, March 8:—There was some disappointment felt among receivers because of the failure of the President to sign the Fordney Emergency Tariff Bill, which bore a 6c duty on imported butter, although it was fully expected that the bill would meet the fate that did befall it. It is now predicted that fully 5,000 casks of Danish butter will be received each week for several months to come. In view of the fact that Danish exchange has deteriorated in value to a marked degree during the past several days, the American butter market is more desirable to the Danes than it has been for some time. It is highly probable that as a result of Danish butter importation, a variable market will obtain throughout the summer.

*Hay quotations represent average of cash sales at these markets. †Nominal. ‡Rolled

Straw—Straw is in fair demand at the several markets but receipts generally are sufficient for their needs. Prices are practically unchanged. Quotations are: Wheat straw—Baltimore $14, Richmond $16, Pittsburgh $14.50, Cincinnati $8, Chicago $12.50, Minneapolis $7.50. Oat straw—Baltimore $18, Pittsburgh $14.50, Cincinnati $8, Chicago $13.50, Kansas City $6.50. Rye straw—New York $18, Baltimore $17, Pittsburgh $15, Cincinnati $15, Chicago $14.50, Minneapolis $8.50.

However, it is barely possible that some emergency tariff law will be enacted by Congress during the first weeks of its special session although sentiment among the leaders in that body seems to be that other legislation should be given first consideration.

At the present time, while there is little Danish butter in first hands, large quantities will be available in the near future. The shipment of 11,200 casks which was expected the first part of this week has not arrived as yet nor will it be available for distribution before Monday of next week as the boat bearing it is at present in Boston where it stopped to discharge passengers. Another shipment of 5,000 casks is due to arrive the first of next week. As the two shipments will aggregate 1¾ millon pounds, the effect of the simultaneous arrival of the two shipments will undoubtedly have a decided effect on the butter market. A sharp break in prices is expected. As the butter markets on the Pacific Coast experienced a decided slump during the past ten days, extras in San Francisco being quoted at about 43c, there is decided movement of western made butter to the eastern markets. Several carloads of California butter are reported to be in transit at present and more will doubtless follow. That butter also will have a decided bearing on this market during the next few days.

It is again very apparent that the price of butter acts as a governor on demand. During the break of two weeks ago, demand became very acute with the result that practically all accumulations of fresh butter of all grades were cleared up. With demand keen, there was a sharp upward trend to butter prices which finally resulted in the quotation on extras reaching the high figure of 54½c which is decidedly high for this season with conditions as they are at present. With the advent of high prices, there was a marked curtailment of demand and the market reacted very quickly. At present, a very nervous condition obtains which is the forerunner of a decided slump in prices.

On Monday of last week, extras were quoted at 53½c and on the following day, the quotation was advanced 1c, 54½c being the high mark for the week and for some time past. On Wednesday, it was very apparent that the highest possible price level, consistent with an active movement of butter, had been reached and a reaction set in although there was no change in quotations. On Thursday, however, prices declined 1c and a similar decline materialized on Friday. On Saturday, there was an unexpected recovery and the quotation advanced 1c. On Monday of this week, it was again apparent that lower prices must prevail if butter moved freely but there was no change in quotation until today when prices declined 1½c. There is an absolute dearth of activity today and it is expected that a steady price decline will be the order of the next few days. Established quotations today are: Extras, 51@51½c; higher scoring than extras, 52@52½c; firsts (90—91 score), 49½@50½c; firsts (88—89 score), 47@49c; and seconds, 38@46c.

W. B. LIVERANCE.

Savage Feed Service Latest Formulas

HOARD'S DAIRYMAN:—Feed prices were recently quoted to Professor Savage of the Feed Service, Utica N. Y., on straight carloads for cash f. o. b. any station taking the Utica rate.

After considering their rates he has made his formulas for the following feed mixtures:

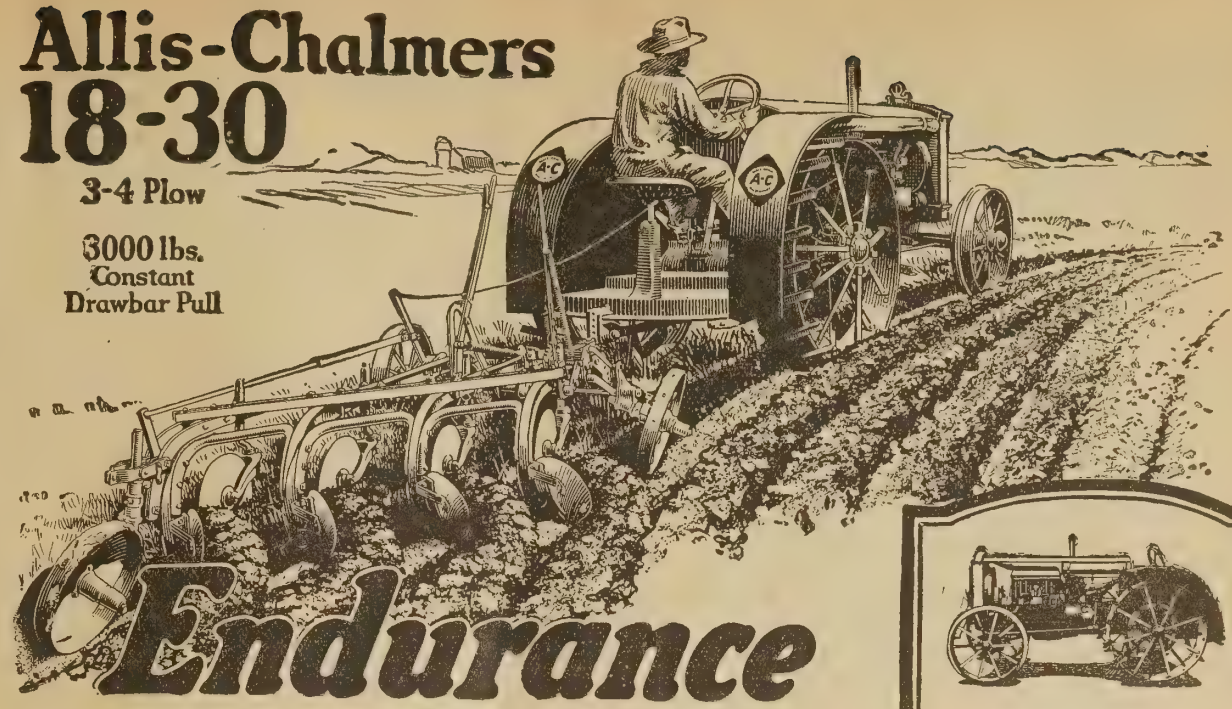
For Dairy Cows

	Wholesale
200 lbs. ground oats or barley	$ 3.85
100 lbs. standard middlings	1.64
200 lbs. hominy or corn meal	3.07
400 lbs. cottonseed meal	7.74
100 lbs. oil meal	2.26
1,000 lbs. will cost	$18.56
100 lbs. will cost	1.85
2,000 lbs. will cost	$37.12

Mixtures for Calves and Young Stock

	Wholesale
300 lbs. hominy or corn meal	$ 4.62
100 lbs. wheat bran	1.52
500 lbs. oats or barley	9.60
100 lbs. oil meal	2.26
1,000 lbs. will cost	$18.00
100 lbs. will cost	1.80
2,000 lbs. will cost	$36.00

Professor Savage suggests using as much high protein feed in the ration as cost and the health of the animal will permit, as the high protein feeds have a much greater manurial value than low protein feeds.



Feed prices in general have continued to drop for the last two weeks, but some feeds have gone up slightly. The most notable drop has been in gluten feeds. Cottonseed meal still remains the cheapest source of protein.

Allis-Chalmers 18-30

3-4 Plow

3000 lbs. Constant Drawbar Pull

Endurance

How Seven Years' Proving and Improving Put Stamina Into Every A-C Part

PLOWS set *deep*—furrows turned at a speed close to three miles an hour—and motor held at full rated horse power hour after hour! In these times of pressure Allis-Chalmers' quality and reserve power guarantee against delay—put you in the field and quickly out again, with every acre plowed when soil is in its best condition.

Oversize bearings; removable cylinder sleeves; heat-treated, cut and hardened steel gears, machined to an accuracy of one-thousandth of an inch and running in a constant bath of oil—these are typical Allis-Chalmers features. Naturally, the Allis-Chalmers owner figures tractor life in terms of greater service. The shocks and strains of hardest going find their match in wear-resisting parts; the over-loads of heavy duty quickly disappear before the brute reserve of Allis-Chalmers' motor.

Now Comes the A-C 12-20!

SO remarkable has been the performance of the A-C 18-30 that every tried and tested feature of this model has been engineered into the new A-C 12-20. It is a 2-3 plow tractor with 2,000 pounds constant drawbar pull—and abundant reserve. Large-scale production, combined with Allis-Chalmers' enormous buying power, makes this tractor one of the greatest values in the industry. Watch for the A-C 12-20!

New Power and Economy Standards Set by $42,500,000 Company

With sixty-six years' experience in building machinery for some of the largest factories and engineering projects in the world, *quality* is only another name for *economy* at the mammoth plant of Allis-Chalmers. So, seven years ago, this company set its vast resources and one of the world's largest engineering staffs at work to build a tractor worthy of the Allis-Chalmers name.

To combine the flexibility of high-speed motors with the rugged strength of heavy-duty power plants, was the first problem Allis-Chalmers sought to solve. Engines of many types were built and run under full load for days at a time. Power output was watched, fuel and oil consumption recorded, and every engine underwent severe inspection. Transmissions, too, were put to rigid tests. The sudden thrusts that gears must stand in service do not compare with those that A-C tractor gears endured. Finally a finished A-C 18-30 took the field. At a touch of the throttle, the perfected Allis-Chalmers motor responded with automobile-engine smoothness—yet conquering every kind of soil with its tremendous flow of power. But Allis-Chalmers was not satisfied. It was the endorsement of the farmer that was wanted!

So A-C 18-30's, in only limited numbers, were released. And not a single owner made complaint about the service he was getting. Now, after the expenditure of $3,000,000—climaxing seven years' development—Allis-Chalmers tractors stand perfected. Now this $42,500,000 company goes into volume tractor manufacturing—offering proven models at prices in keeping with a gigantic production capacity of 100 tractors a day!

Easy to Master Allis-Chalmers Construction

Allis-Chalmers tractors appeal most to men who see beyond the paint—who look to the very working vitals for the long life which can begin only there. You will appreciate the ease with which every part may be reached; you will recognize in Allis-Chalmers simplicity the total absence of unnecessary parts which only add to the weight and subtract from performance. For example, there is no "frame" to an A-C 18-30. Motor is bolted direct to transmission housing—forming a rigid, trouble-free "backbone" which resists being thrown out of alignment, no matter how rough the travel.

See Allis-Chalmers tractors—notice their clean cut, easy-to-master design! And remember, back of each model stands a $42,500,000 company—guaranteeing the super-service you have a right to expect from a tractor bearing the Allis-Chalmers name.

ALLIS-CHALMERS MFG. CO., Dept. 28 F, Milwaukee, Wis.

WRITE FOR BOOKLET TODAY: Ask for the 18-30 or the 12-20 booklet—or both—giving complete details of exclusive Allis-Chalmers construction features which make these tractors so superior.

Colorado Holstein Meeting

The Holstein Breeders' Association of Holly, Colorado, held its annual meeting February 12th and elected W. S. Partridge president, J. A. Pierce, vice-president; C. F. Hampton, secretary and treasurer; and J. H. Leonard, George D. Shell, Joe Boetto, and Edward Klein, directors. A number of very excellent sales were reported, the demand for good animals being good. A committee was appointed to confer with the dry land farmers in this section to discover whether better methods of dairying cannot be taken up by them, the plan being to introduce Holstein cattle on these farms.

Wasn't Carlyle right? "Work rids us of three ills—tediousness, vice, and poverty."

SUPERIOR

Lime Your Soil and Raise Plenty of Feed

Ten to one, all your soil needs is SUPERIOR LIMESTONE to yield heavy stands of Alfalfa, Clover and Soy Beans. First year increase in production more than pays for Lime used.

Free Truog Soil Test. Mail small sample of soil and we will tell you how much Lime you need.

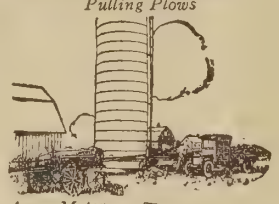
"Most Useful Machine On the Farm"

THIS Avery machine is more than a motor cultivator and more than a tractor. It is, as one owner says, "the most useful machine on the farm."

Not only plants and cultivates all row crops such as corn, cotton, peas, beans, beets, successfully, but also pulls plows, harrow grain drills, manure spreaders, hay loaders, etc., runs feed grinders, wood sawing outfits, pumps, silo fillers, small threshers and other belt machines. Does all that any small tractor can do, and a whole lot more than ever expected in a motor cultivator.

Here's the practical machine for all-around work on any size farm. Built in 6-cylinder two-row and 4-cylinder one-row sizes and sold at a surprisingly low price.



Write for the Avery Catalog showing this and other machines in the complete Avery Line, including tractors in nine sizes, tractor plows, harrows, drills, grain-saving threshers, motor trucks, etc.

The new Avery adjusted prices are based upon what materials cost now regardless of what we paid for them. Write for Avery 1921 prices.

Simple Ways of Feeding Dairy Cows

(Continued from page 358)

grouped into classes according to their percentage of digestible protein.

The percentage of digestible protein in a grain mixture can be determined as follows: Take the number of parts of each feed used and multiply the percentage of protein by the number of parts. Add the percentages and divide by the number of parts.

If it is desired to make up a grain mixture from corn, oats, and linseed meal to balance with alfalfa hay as roughage for a herd of medium producing Holsteins, the process would be as follows: Alfalfa hay is a legume roughage and belongs to the class of high protein roughages that require from 13 to 16 per cent protein in the grain mixture. Start by taking one part of each concentrate.

1 part corn meal.....	5% digestible protein
1 part oats.....	10% digestible protein
1 part linseed meal....	30% digestible protein
3 parts mixture contains	45 parts protein

1 part equals 15.0 of 15% protein in the mixture.

Now the mixture need not contain more than 13 or 14 per cent of protein with such a hay so the mixture may be changed so that there will be less protein in it. This may be accomplished by adding more parts of corn or oats or both. The same result could be obtained by reducing the quantity of the linseed meal. The mixture is palatable since all its constituents are palatable so that part is all right. As it stands it is a little heavy, that is, it lacks bulkiness. The cost depends upon the conditions and varies greatly. Suppose corn is worth $40 a ton and oats, $35. In such a case it would be cheaper to add oats than corn. Oats is slightly higher in mineral content than corn, so from that standpoint is to be preferred. The linseed meal insures enough laxativeness in the ration even without silage. The addition of oats gives the mixture a lower protein content. By trial it is found that a mixture of 1 part corn, 3 parts oats, and 1 part linseed meal contains 13 per cent of digestible protein. The roughage and the grain mixture will work well together and if as much hay is fed as the animal will eat up clean and the grain in proportion to milk yield the results should be satisfactory.

Let us take another example. Suppose we have corn silage and clover hay available as roughage. The feeding of corn silage and clover hay places the roughage in the combination class which necessitates from 15 to 18 per cent of protein in the grain mixture. It will be considered that the desired percentage of protein is 15. As a basis, the farm grown grains, corn and oats, should be used. It is apparent that some high protein concentrate will have to be added to corn and oats to bring up the percentage of protein. Since cottonseed meal and linseed meal cost about the same per ton, cottonseed having the larger percentage of protein is the cheaper as a source of protein.

1 part corn meal.....	5% digestible protein
1 part ground oats....	10% digestible protein
1 part cottonseed meal	35% digestible protein
3 parts mixture equals	50 parts protein
1 part equals 16.66 pounds	
Add	
1 part ground oats....	10
4 parts	60 parts
1 part	15 parts or 15% of protein in mixture

(1 part usually stands for 100 pounds of feed)

As far as the percentage of protein is concerned, the mixture is satisfactory. With two parts oats to one part each of corn meal and cottonseed meal, the bulk and palatability are satisfactory. Considered in connec-

A 1-Piece Cow Stall ONE Attachment

THAT describes the CLAY Cow Stall. Easily and quickly put up—and *stays up*. Nothing to break. Warranted not to bend. For bigger dairy profits—through safety, sanitation and a saving of time, feed and labor—equip with the

CLAY SANITARY ONE-PIECE STALL

Strong Smooth Steel Tubing No Angles, Joints Or Heavy Castings

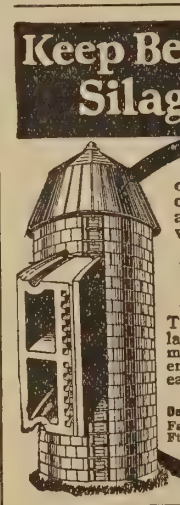
Simplest, strongest cow stall made. Outlasts the barn. Designed with the help of hundreds of dairy farmers who *know* what the dairy farmer needs. None of the faults of old-style stalls — all of the good points barn equipment can have.

CLAY Equipment will save you *hours* every week, keep your herd comfortable and contented and pay dividends from the start in a bigger yield of milk.

CLAY 2-Way 1-Hand Stanchion

Instantly closed or opened *both* ways with *one* hand. Eliminates troublesome sure-stops. Locks at 6½, 7½, or 8¼ inches—fits either cow or heifer without change. Hangs squarely in center of stall—cow can't miss it. Lock guaranteed brute-proof.

YOU CAN MAKE MORE MONEY



CLAY Guaranteed Equipment makes dairy-barn work quick, easy, pleasant. In hundreds of dairy barns it has quickly paid for itself and increased cow earnings. It will make money for you.

tion with the roughage there are large enough quantities of the various mineral compounds present. Perhaps the only question would be as to whether cottonseed meal formed too large a part of the grain mixture. This might be questioned for very high producing cows if the grain were fed in proportion to milk yield, but, for average producers, the proportion is not too great. When there is no succulence in the ration it is advisable to use some linseed meal for the laxative effect.

In connection with the general rules for feeding, three guides for general feeding may be given especially with reference to the quantities to be fed. Briefly they are as follows:

1. Feed all the roughage that the cow will eat up clean. Only restrict the roughage when the cow becomes over fat.

2. Feed the grain mixture in proportion to milk production, 1 pound of grain daily for each pound of butterfat produced weekly. Or feed one pound of grain daily for each 3 pounds of milk produced daily for Jerseys or Guernseys up to 40 pounds of milk; above that 1 pound of grain for each 3½ pounds of milk; for Holsteins 1 pound of grain for each 4 pounds of milk produced daily up to 50 pounds of milk and then 1 pound for every 5 pounds of milk; Ayrshires, one pound of grain for each 3½ pounds of milk.

3. When the cow fails to respond in milk production, reduce the grain.

4. Observe the cow, her weight, and production and try to keep her in good condition and well.

Some feeders limit the production of their cows by not giving them enough water. Such a practice is extremely shortsighted since water is the cheapest ingredient of milk. Fortunately there is no law or regulation that prohibits the giving to cows all the water that they want. The quantity needed will depend upon the kind of feed and the quantity of milk being produced. Cows on dry feed require more water than those on pasture. Ideally, water should be before the cows at all times, but since this is not always practicable, watering twice a day is very satisfactory for ordinary conditions.

Oregon Dairymen's League

A Series of Intelligent Questions Answered

One of the new members of the Oregon Dairymen's League recently submitted a series of questions to the officers of that association that open up a fund of valuable information. Readers of Hoard's Dairyman will be interested in these questions and the answers as prepared by the League. They are as follows:

Q. How long has the Oregon Dairymen's League been organized? A. 3½ years.

Q. How long has the League been handling dairy products under its present 5-year contract? A. Since July 1, 1920.

Q. Previous to this contract, what method did League members employ to dispose of their product? A. The League sold it on commission, charging 5c per cwt. for milk and ¼c per pound fat for cream.

Q. How many members has the League at present? A. 2,228 contracts accepted. About 600 more signed, to be taken over this month.

Q. How much capital do you estimate these members control? A. About $25,000,000.

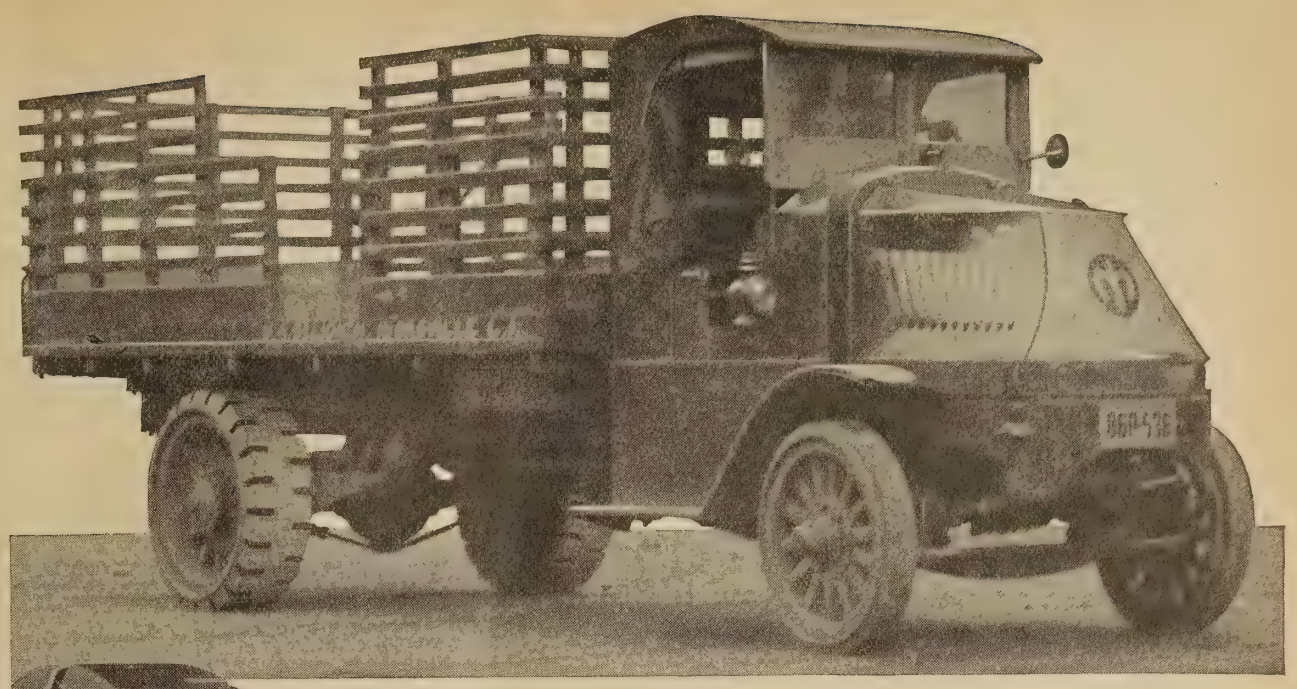
Q. How many plants has the League in operation? A. 18.

Q. Can the League secure as much, relatively, for its products as privately owned creameries? A. Have netted members from 1 to 12 cents a pound butterfat more on the pools that have closed.

Q. Do you consider that there is any opportunity whatsoever for capital to get control of the League? A. None. It is a straight membership organization with one vote for each member and no proxies.

Q. Is there a demand at present for all of the League product? A. Yes. Our members have created a demand for more than we can supply. The demand has been created by asking dealers to handle our product.

Q. Would a systematic advertising campaign increase the demand to the extent of boosting the price? A. Yes, after we have graded up and standardized the product.



Q. About what date of the month can members expect their 75 per cent payment? A. On the 25th of the following month.

Jersey Cattle Notes

For week ending February 25:

Number of animals registered: Bulls, 202; cows, 528; total, 730. Number of transfers recorded: Bulls, 143; cows, 353; total, 496.

"Deflation is a matter of passing the buck. When the farmer gets it, he has no one to pass it to."

Why farmers are buying Caterpillar Tires

One of the problems of the truck-owning farmer has been to find tires that will give him traction on all the various kinds of roads over which his truck must travel.

Many farmers, finding that ordinary solid tires could not do this, have turned to the big pneumatics as a possible solution of their problem.

Those, however, who have put Kelly Caterpillars on their trucks after trying out the big pneumatics say that Caterpillars give them as much traction as pneumatics and a great deal more mileage.

Besides which, Caterpillars cost less and are more dependable.

Made in sizes suitable for trucks of all types and weights.

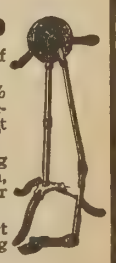
THE GREAT UNITED LINE FARM MACHINES



Puts Horses In Prime Condition

Most horses will work if they feel right. When you have to force them, something is wrong. No horse feels right when worked hard on warm spring days unless his heavy winter coat is clipped.

Spring clipping is the best protection against colds, stiffness and more serious horse ailments. It pays big, and progressive farmers do it with a Stewart No. 1 Ball Bearing Clipping Machine. Price $14 at your dealer's, or we ship direct on receipt of $2 and you pay balance on arrival. Guaranteed to please or money back.

Bigger Wool Crop

The wool is an important part of your sheep profits. Get it all.

Hand blade shearing leaves 15% of the wool crop on the sheep, besides an uneven fleece that won't bring best prices.

This Stewart No. 9 Ball Bearing Machine shears quick and clean, leaves no ridges. Quickly pays for itself, even on a few sheep.

$22 at your dealer's, or buy direct from us, sending $2 and paying balance on arrival.

If your flock is large, write for Catalog No. 69 of power shearing machines.

When Writing to Advertisers, Mention Hoard's Dairyman

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, MARCH 7—The chief activities of the Maryland—Virginia Milk Producers' Association at this time are the financing of the proposed surplus milk plant which was voted at the annual meeting. Manager McLaughlin and the officers and directors are carrying on an energetic campaign for signatures to the loan agreement from the members, the plan contemplating the deduction of the amount subscribed from the milk checks of the members who agree. Those subscribing receive certificates of indebtedness, on which the association agrees to pay six per cent interest, and also agrees to pay off the indebtedness, returning each member the entire amount subscribed within five years. The campaign is to raise one hundred thousand dollars, which is the amount estimated for the construction of the plant.

The price reduction in Washington has helped the milk surplus which was developing here, and the influx of inauguration visitors helped to clean up the stock of cold storage cream held here. Unusually warm weather followed the first of the month, so milk flow increase is to be expected, and the association is preparing to take care of it.

⚜

A recent meeting of the Washington Board of Trade heard a report of a committee on Public Health, approving the tuberculin test for all cows from which milk is received in this city. This came about by reason of the court action to compel the Health Board to admit New York State milk from herds not tuberculin tested. Some effort was made at the meeting to defeat or delay the adoption of the resolution, on the argument that pasteurization made the milk safe, no matter whether the animals were free from tuberculosis or not. Dr. Wiley, who was present, made a characteristic address, after which the resolution was adopted without opposition.

⚜

The agricultural appropriation bill, held up until the afternoon of the last day's session of Congress, by the row over the free seeds proviso, went through at last. It carried the authorization for a World Dairy Congress in 1922, for which a long effort was made by the Washington members of the provisional committee named at the last dairy show. Plans for a definite business organization to arrange and finance this international gathering, will be pushed at once, now that official endorsement has been secured.

⚜

B. H. Rawl has been definitely appointed Assistant Chief of the Bureau of Animal Industry and Dr. C. W. Larson, who has been Acting Chief of the Dairy Division, has been appointed Chief of that Division. The change was effective last week, but has not previously been announced. Dairymen everywhere are indebted to Messrs. Rawl and Larson for sincere and well directed effort of high character to make this Bureau and Division of service and value to the industry. They rank high in the personnel of the great Department of Agriculture, which numbers on its staff some of the finest technical and scientific men in the world, and so far as their work is concerned and so far as the support given this work will go, the dairy industry will be well served.

⚜

The inauguration of President Harding on Friday, marked by simplicity and dignity, but attended by a great gathering of people, was followed on Saturday by the installation of his cabinet advisers in their respective positions, completing the turn-over of administrations. Secretary of Agriculture Wallace was sworn in with a ceremony as simple in its way as that of his chief, at eleven o'clock, Saturday forenoon. The ceremony was performed by Chief Clerk Reese of the department, and heads of bureaus, a few newspaper men, and photographers being present. Retiring Secretary Meredith was first to offer congratulations. Secretary Wallace told newspaper men that there were no changes or appointments to be discussed or announced. Later on Saturday announcement came from the White House that Assistant Secretary Ball had been re-appointed. Assistant to the Secretary, Floyd R. Harrison, tendered his resignation effective March 4th, and has left the department, going to New York to take a position in a financial concern with Eugene Meyer, former chairman of the War Finance Corporation. Some of the other subordinates in the secretary's office have also resigned. Mr. Harrison had been with the department for a long time, starting as messenger and rising to the position of chief executive assistant to both Secretaries Houston and Meredith and was their spokesman before legislative committees as well as chief administrative assistant in the office. For the present at least, it is indicated that his place will be filled by Assistant Secretary Ball.

⚜

Revenue Commissioner Williams resigned March 4, somewhat unexpectedly so far as the public was informed. He was ill for a few days following the "adulterated" butter hearing, February 25, and did not make any decision or take other action on this case. As it stands, the ruling will become effective April 1, just the same as if no hearing had been held, unless a new commissioner, or a new attorney general, makes other announcement. No steps have been announced as yet as to further procedure by those in charge of the opposition to the ruling.

⚜

Indictments against officers of Louisiana Dairymen's Co-operative Association have been dismissed on demurrer by defendants, according to telegram received by G. P. Warber, National Milk Producers' Federation, from Edgar W. Cahn, their attorney.

New Farmer Must Dress the Part

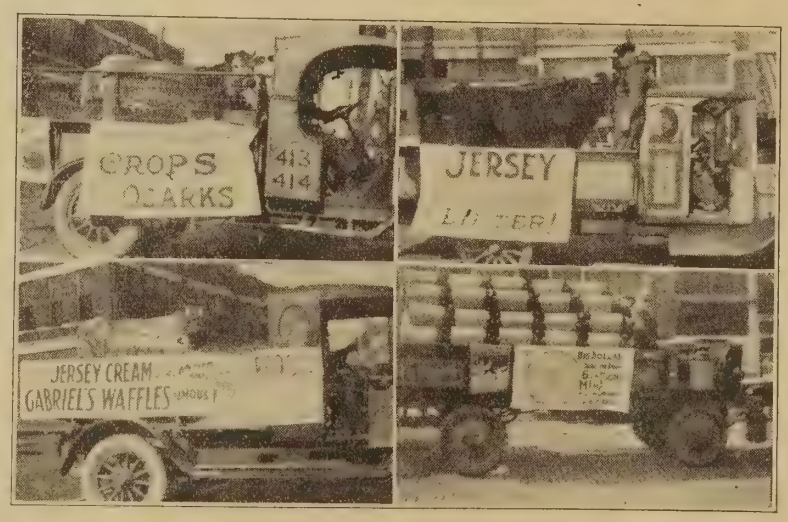
It's Not the Clothes that Make the Man—but Good Clothes Help a Lot

HELEN S. K. WILLCOX, NEW YORK

I WAS much impressed with a letter in a recent issue discussing the unfortunate habit some farmers have of appearing in public or elsewhere in clothes which identify and betray the so-called "hick" or "hayseed".

Your correspondent made the point that while clothes do not make the man, they help more than some of us seem to be aware, and that the business of farming will never receive its rightful measure of respect until we eliminate for all time some of our old fashioned standards of dress and appearance and manner and in their stead try to dress and appear and talk more like other professional men.

All this is perfectly obvious and everybody recognizes it except the blissfully ignorant parties most concerned. But we are improving fast in this respect, nevertheless, and any sizeable meeting of farmers and dairymen shows more white collars and tasteful cravats than many would suppose. The idea of conforming in our dress to the standards of the rest of the world is neither sissified nor silly. It is strictly necessary if we want to make the world understand at last that we aren't boors and clod-hoppers but a capable, intelligent class no different any longer in outward appearance than at heart from our business associates in other callings.



But the farmer has got work before him to counteract the deeply ingrained thought in the world's mind that he invariably murders the king's English; wears cow-hide boots and a flapping straw hat, and is simple and uncouth to the point where those who particularly notice these things and who are numbered with him desire to hang their own heads in shame. They have hung all of these things on us and we have nothing to be proud of that occasionally in these farm-forward days the shoe often pinches. The thought, however, to which I particularly wanted to call attention is that many farm papers and farm leaders seemingly fail to recognize the farmer's personal appearance; handicap and insist on presenting pictures and photographs invariably depicting him in his untidy work clothes, rather than "dressed up", as even the farmer would be naturally upon the important taking of a photograph.

I have in mind the farm paper which is the worst offender in this matter, this magazine in question always showing Tom, Dick, and Harry at their worst, or, supposedly dressed in their regulars, with never a white collar or decent suit of clothes on any account. On the other hand, I can't recall that Hoard's Dairyman has ever published photographs, excepting rare instances, where the subjects appeared any different than the average man. To appear before the thousands of readers of the ordinary paper, most farmers would choose to be clad even as other men, instead of set apart as a class which never dresses up and must remain bewhiskered and barny and socially half-broke to the bitter end.

It makes me writhe to see the pictures zealous city editors always select as typical of those remaining on the old farm. One ambitious city daily in my territory has a page, and a good one, devoted to the farm and its interests, and "photographs" of prominent and near-prominent farmers are often run. These pictures are usually snapped by the paper's own reporter-photographer, and a worse looking lot of scalawags, train robbers, and illiterates you would fail to find in a day's journey than these farmers photographed with the disadvantage of their old clothes. I warrant the same men in the majority of cases would look like any other average citizen if given half a chance, but, no, tradition has it that farmers must play their parts on the world's stage as rubes and jokes and goats—while their audience takes them at their own value and laughs merrily at the funny, back-woods ways of old Uncle Cy!

It is not that we need be ashamed of our honest insignias of hard work—sturdy boots, strong shirts, overalls, and frocks, but we don't necessarily need to appear in these at meeting as well as at mill, for at meeting it is only right and decent to merge ourselves in the crowd, not as farmers but as citizens, and to do this successfully we must leave the smell of the barnyard and the particular trophies of our trade at home.

The farmer is making gigantic strides forward today in the conduct of his own affairs and most of him is incidentally keeping pace in personal appearance. That this latter counts tremendously is already apparent to thinking farmers who have mixed with successful men of other

FLOATS IN THE JERSEY PARADE

The meeting of the Southwest Jersey Breeders' Association, held at Springfield, Mo., was voted by those present to be the best gathering which the association has ever held. President Golloday presided at the meeting at which Mr. Woodruff, president of the Springfield Chamber of Commerce, and Mr. C. E. Randall, cashier of the Bank of Commerce at Springfield, spoke. Mr. Randall outlined the plan his bank is following in financing new dairymen. He believes that $300,000 can be raised for this purpose. In the afternoon a Jersey parade was staged, the character of which is shown by the illustrations published herewith. It was under the direction of W. F. Delp, County Agent. At the afternoon program, Professor A. C. Ragsdale spoke on "Jersey Progress Through Official Testing"; J. G. Winkjer discussed the organization of bull associations; Professor H. E. Dvorachek discussed "The Essentials of Successful Jersey Breeding"; E. G. Bennett, Dairy Commissioner of Missouri, talked on "The Future of the Jersey in the Ozarks"; and Secretary F. W. Atkeson reported the results of the Association's activities since June 1, 1920.

trades and on whom they hope to make an impression which will still further help the progress of American agriculture. We are all brothers under the skin, true enough, but it is a fact, right or wrong, that a clean-cut, business-like appearance gained through correct clothes is a big help for that farmer who wishes the world to respect him and his job. It would be a long step in the right direction to concentrate a little more on this very important part of our new forward relations with the world that we may gradually overcome the impression that we are canny and sly, perhaps, but hopelessly un-American so far as being up and coming is concerned and therefore must naturally be the rest of the world's meat. Let's unite hereafter in refusing to stamp ourselves as unprogressive types of yesterday, but instead prove to everybody that our jobs call for and contain men the equal in every way of other successful men. I believe it would prove worth while.

Controlling Weeds

HOARD'S DAIRYMAN:—More than half the battle against the weeds that infest cultivated crops can be fought before the crop is planted. Of course, corn is one of the farm crops that requires exceptionally good care to keep it free from weeds; being planted far apart weeds have a chance to grow before the corn gets tall enough to shade the ground or to keep them out. Close planted

The light spike toothed harrow is valuable for breaking the crust on the soil after a crop has been planted.

grains, like oats, wheat, or barley, of course, can keep down the weeds unless there is extremely wet or foul piece of ground.

Plowing the land in the fall and then turning under deeply trash and weed seeds is a good way of disposing of last year's growth. Weed seeds, however, stay in the soil for a good many years and it is easier to remove them during germination time. With fall-plowed land it is possible to get on the land early in the spring with tillage implements and tear it up in such a manner as to destroy the weeds as they begin to show their heads above ground.

When land is plowed in the spring for corn or other farm crops, it is necessary to work the soil down into a firm, moist, and fine seed bed. With the use of the spring tooth or disc harrow, it is possible to refine the soil and at the same time destroy the weeds that begin to sprout just as soon as temperature conditions are favorable in the spring. We find, however, that going over the soil a couple of times with a spring tooth harrow will hold the weeds in check. When drawn by a tractor it is usually possible to get over the ground once or twice oftener than when horses are used to fit the land for planting.

After the crop is planted to either potatoes or corn, the weeds will begin again and sometimes grow faster than the crop in unfavorable crop seasons, so that some method must be devised to keep them in check before the planted crop is ready to cultivate. The spike tooth harrow is valuable at this point for the teeth may be set at an angle so that the crop is not taken out of the ground and yet the surface or crust of the soil is torn up, for it is just under this crust the weeds are germinating. The spike tooth harrow will make it possible to control the weeds after the crop is planted until it is large enough to cultivate.

We have tried out a number of kinds of cultivators and have no particular favorite, except that certain kinds should be used under certain conditions. Where pea vines, wild morning glory, etc., infest the corn field the drill gang attachment for corn cultivator is quite satisfactory as it throws the soil to some extent and of course chops these parts into pieces and even cuts up the roots. The disc gang on the corn cultivator can be set so as to work very closely on the corn plant, the disc being set in a manner to throw the dirt away from rather than up to the plant. A cultivator equipped with spring tooth gang shovels is also quite effective in getting rid of weeds.

A quick way of cleaning up the corn field after the corn is plowed the first time is to go crossways on the corn with the common weeder. This breaks the crust between the hills of corn not touched by the plow and destroys all weeds that may be already growing in these thin strips.

The disc cultivator drawn by tractor is effective in keeping soil clean and getting rid of trash. Before oat stubble is plowed for wheat it is best to disc it by maintaining a fine mulch on the surface of the ground and chopping the wheat straw or trash deeply into the ground. The same practice is valuable before corn land is plowed either for oats or to be put back to corn again. The disc harrow will chop up the cornstalks in such a way that they will cause no further damage either in cultivating or harvesting the crop, while the discing of stubble land is the first control to be exercised over weeds.

In all this practice it should be remembered that the most effective time in destroying weeds is during a dry spell. If the ground is wet and the soil is weedy, no matter what kind of implement is used, weeds are usually dug out of the ground and then simply reset again. Weeds in a wet soil are not disturbed much by being replaced, but if the sun may strike them and the ground is dried off to some extent, then they will wilt and die before night comes on or before they can secure extra moisture.

Ohio. C. M. BAKER.

Milk Substitute Bill Defeated

HOARD'S DAIRYMAN:—Dairymen of Washington were defeated in their effort to put through the present session of the state legislature House Bill 29, the Milk Substitute bill, which would have prohibited the manufacture or sale in this state of substitutes for milk or butter containing other fats or oils than butterfat. It was designed to protect the dairy industry of this state, as has been done in Ohio, against substitutes using imported cocoanut oil instead of butterfat and sold in cans or bricks like condensed milk or butter. It was introduced by Representative O. R. McKinney of Pierce County, president of the Pierce County Dairymen's Association and vice-president of the United Dairy Association of Washington, of which the Pierce County Association is a subsidiary. It had the united backing of the state association, and of many farmer organizations not directly interested in the dairy business, but it lacked 10 votes of passage. A motion to reconsider action passed, but the bill was again beaten.

The number of dairy cows in the state has been materially reduced during the past two years, largely, dairymen say, because of the effect of the manufacture of Hebe and butter substitutes. They say that 75 per cent of the remaining 216,000 cows are in very small herds which it will be easy for owners to dispose of, and that such disposal will proceed rapidly now that Hebe has been legalized in Washington for another two years.

Washington. GEO. N. ANGELL.

Three Champion Jerseys in Three States

Meridale's Golden Lassie, a Jersey yearling owned by H. P. Lutz of North Carolina, has become champion for her age in that state with a production of 5,719 pounds of milk containing 322 pounds of butterfat.

Arkansas also has a new yearling champion in Oxford Lass' Jap Maid. This heifer, owned by Mrs. G. N. Clouston, has made a production of 6,312 pounds of milk containing 311 pounds of butterfat. She carried a calf the greater portion of the period in which this record was made.

In Ohio, a senior two-year-old Jersey has recently completed a new state record for this age. This heifer is Chieftain's Flora, owned by Woodcliffe Farm. In one year she has produced 13,178 pounds of milk containing 689 pounds of butterfat.

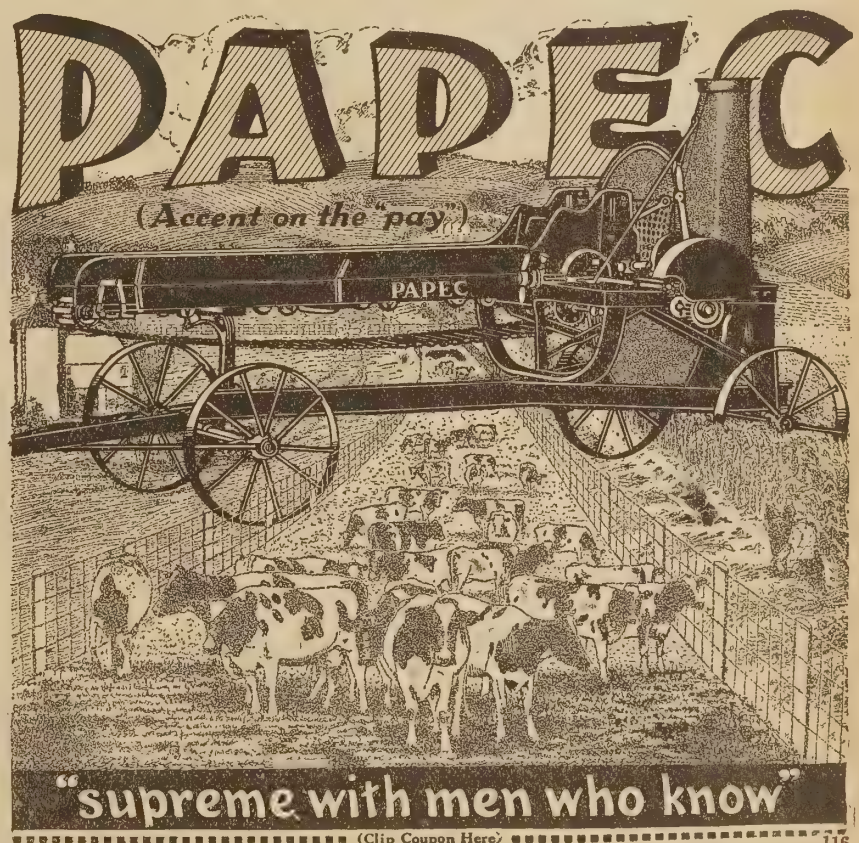
Accent on the "pay"

Papec is pronounced "pay-peck"
—with the accent on the "pay"

WHILE it is only a coincidence that in the name Papec, the word "pay" should sound with special emphasis, it is not a mere coincidence that, when you consider the purchase of an ensilage cutter, the Papec machine should stand out above all others.

For twenty years the Papec has been built upon the *same* mechanical principles. That these principles were correct twenty years ago, and that they are correct today, is shown by the demand for Papec Ensilage Cutters—a demand which has made the Papec plant the largest exclusive ensilage cutter factory in the world.

You will want to know about these principles of Papec construction. You will want to know why the Papec operates with *less power*, and how the fact that it operates with *less power* proves the efficiency of the Papec throughout. Our catalog illustrates these points, tells why you should *"Own Your Own Papec,"* how we can make such a remarkable guarantee as this:



"We Guarantee any Papec Cutter to throw and blow ensilage perpendicularly to the height of any silo, with any power, provided the speed of the cutting wheel does not fall below six hundred (600) revolutions per minute. We also guarantee that any Papec Cutter will cut and elevate more ensilage with the same power than any other blower cutter."

Own Your Own Papec—It Pays

BRISCOE

The Leader of Light Weight Cars

The Best Car Value in its Field

That's the verdict wherever the 1921 Briscoe is shown. The more exhaustive the investigation is, the more the car is appreciated; the wider the comparison, the more conclusively the superior value is proved.

The beauty of line and its perfection of finish please the eye; its easy riding gives comfort over country roads; its exact balance and light weight reduce strains and increase mileage; and its world-famous motor sets a standard of economy that is recognized everywhere.

See the Briscoe at your dealer's; you will find in it all you have wanted in a motor car; and you, too, will say it is the best value in the light-car field and far and away the best adapted to country use.

Going Hard? Not for Briscoe!

Hills and heavy going have no terrors for the Briscoe. Its light weight and unusually efficient motor make sport of them. Yet owners' records of 25-35 miles per gallon are the rule, not the exception.

Seattle, Wash.	2.50	10—12	
Spokane, Wash.	3.25	14	.50
Milwaukee, Wis.	2.30	10	flat

†See Table III for prices for these cities.

*In actual practice this allowance is made on the basis of a certain price per hundred of milk of a certain test one-tenth of the price per pound fat being paid or deducted for each one-tenth per cent above or below the stipulated basic test. Where the word "flat" appears in this column, it means that no allowances are made for butterfat content but the milk must not be lower in test than legal requirements and must not be adulterated or skimmed.

The prices quoted for producers are for milk testing 3.5 per cent and delivered f. o. b. city, from which must be deducted the various transportation costs in order to get the actual price. In certain cities the prices given apply only to that portion which is considered as the producers' average production, the surplus being either handled by the producers' association or the dealers at somewhat lower prices.

The prices given are here reduced to the comparable basis of 3.5% fat, as different cities vary from 3% to 4% as the basic fat test. To reduce the prices per hundredweight to either a gallon or a quart basis divide by 11.63 or 46.33, respectively.

The prices paid by consumers are for average testing milk delivered in quart bottles. It is the grade of milk most generally sold in these cities and in most cases is for pasteurized milk.

Country Shipping Stations Retail Prices

Prices per cwt. for standard grade milk that are paid at the dealers' country receiving stations or at producers' railway shipping plants, as also for prices f. o. b. city, are given in Table III for the month of February.

Table III—February Producers' Prices Per Hundred F. O. B. City and at Country Stations

	F. O. B. city	Country stations
Bridgeport, Conn.		$2.92
Hartford, Conn.	$4.22—4.52	2.94
New Haven, Conn.	4.42	3.00
Washington, D. C.	4.07	2.55—3.05
Chicago, Ill.	2.93	2.35
Baltimore, Md.	3.66	2.92
St. Louis, Mo.	3.37—3.49	2.69
Newark, N. J.	3.31	2.78
Trenton, N. J.	3.48	2.91
Buffalo, N. Y.		2.62
New York, N. Y.		2.78
Cleveland, Ohio	3.25	2.70
Cincinnati, Ohio	3.30	2.70
Pittsburg, Pa.	3.61	2.70
Philadelphia, Pa.	3.48	2.88
Harrisburg, Pa.	2.94	2.59
Wilkes-Barre, Pa.		2.78

Prices reported for all of the above cities represent those agreed upon by dealers and an active producers' marketing association.

Retail Prices

Table IV gives for a few cities the retail prices of special milk, certified milk, cultured buttermilk, cottage cheese, and cream for February, 1921:

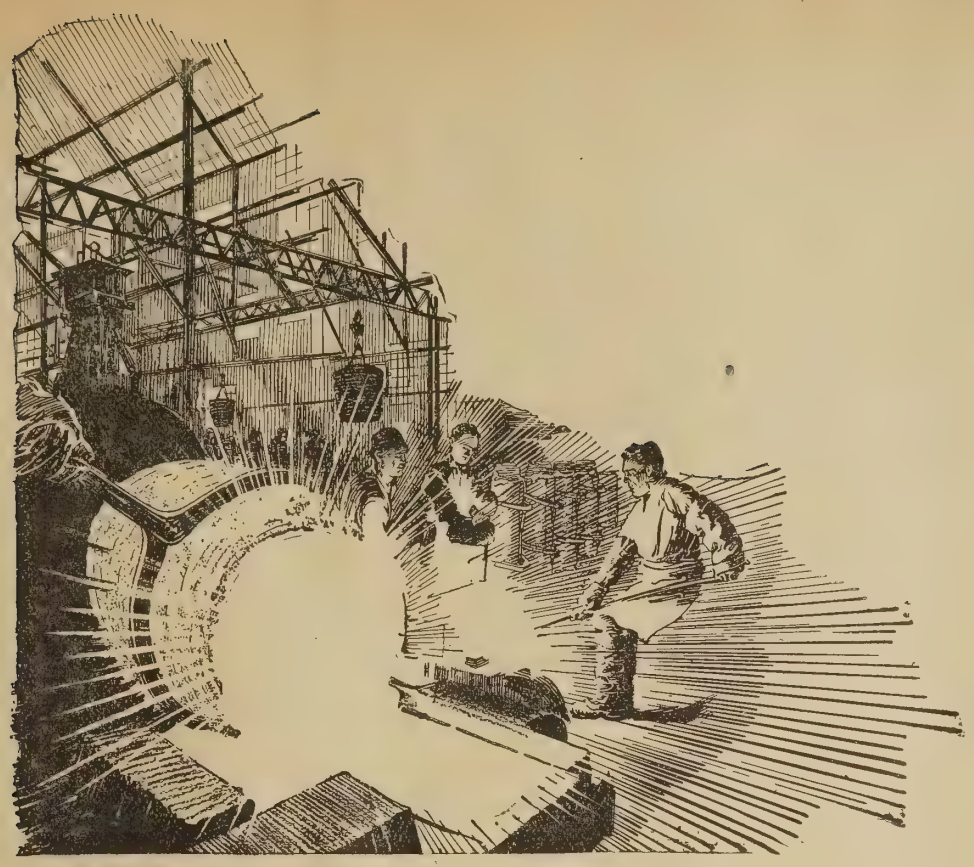

Table IV—Prices for Special Grades

Facts on Farm Labor

A study of Wisconsin farms has shown that in 1910 forty per cent more labor was required than in 1880. This was due to the great increase in live stock farming which requires considerably more labor than does grain farming. The study also shows that only one-third of the labor on Wisconsin farms is done by men working out and indicates that the best farm hands on the modern live stock farms are the sons of neighboring farmers who are looking forward to owning farms themselves. According to investigations by H. C. Taylor, wages in the southwest part of the state average about $10 per month higher than in Central and Eastern Wisconsin. It is found that new methods of paying wages have improved the relationship between the farmer and his hired help. While different wage scales are usually employed for winter and summer work, it has been found that the most satisfactory system is a uniform wage scale throughout the year. Good results have been secured on some farms by the payment of bonuses to men who stay for a full year's work.

Where Disston Quality Is Born

There is something more than a proper mixture of metal put into the crucible when Disston steel is made.

It is an unseen, intangible ingredient—yet as big and real as the tremendous plant in which Disston Saws and Tools are made. The long experience of men whose fathers were Disston steel workers, whose grandfathers worked out the secrets of fine Disston steel generations ago—this is what has made the present quality of Disston steel.

Under the greatest test of all, hard service over a long period of years, the quality born in Disston steel is revealed. The greatest praise of Disston Saws and Tools comes from men who have used them longest, men who write of these tools with a friendliness, and even affection, seldom given to inanimate objects—and there could be no higher tribute.

Send for booklet on the selection, care, and use of Disston Saws, Tools, and Files.

Your Implements and Your Credit

THE farmer, like the manufacturer, must frequently turn to the banker for credit in order that his production may go on.

In extending credit to the manufacturer, the banker takes account of the plants and their equipment, of the condition of the machinery used.

But most of all he takes account of the organization, reputation and good will — the value of the trade-name.

He knows that when he finds these things he can more safely advance the funds that every business man requires from time to time.

Your equipment and your methods influence the banker in the same way. When you use farm implements that bear so well-known and dependable a trade-mark as E-B, you are increasing your credit standing.

Your banker will be more disposed to aid you where and when he can. He knows of the long life and satisfactory service which E-B implements give, and he appreciates the importance of your being able to obtain repairs promptly through E-B branches and dealers.

His sound business judgment sanctions your choice of E-B tools.

Association Notes

Troy, Pennsylvania:—A few unprofitable cows were sold during February. January market milk testing 3% sold for $3.06 per cwt. and 4c per point above. The creamery paid 54—60c per lb. for fat. Feeds sold as follows: gluten, $2.25—$2.75 per cwt.; corn meal, $2; Unicorn, $3.80; cottonseed meal, $2.50; wheat bran, $2.10; molasses feed, $2.35; oil meal, $3.

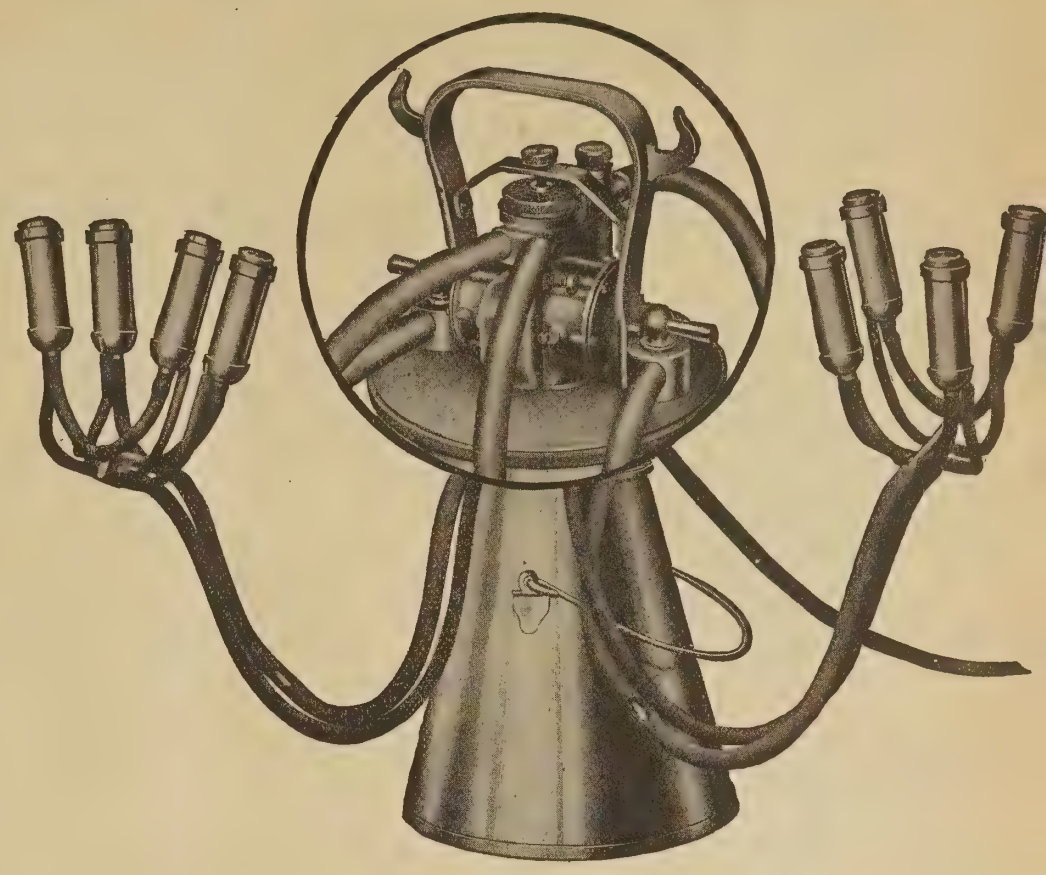
Du Page County, Illinois:—The last half of the association year started with the month of January. Two new members joined, making a total of 25. One member did seven-day testing during the month and several are planning on doing more A. R. O. work. Six grade cows were sold for dairy purposes. Two grades, undesirable but not unprofitable, were sold to the butcher. Six pure-bred heifers were sold to the Kane County Calf Club. January 3.5% market milk sold for $2.50 per cwt. and 4c per point above. Milk retails for 14c per quart and butter for 56c per pound. Feed prices: Alfalfa, $25 per ton; silage, $6; barley, $35; oats, $32; bran, $35; oil meal, $50; gluten, $50; corn, $27; cottonseed meal, $40.

Dallas County, Iowa:—This association is now "100 per cent" in the use of silos and pure-bred bulls. Two cows were sold during February for beef. February market milk sold for $3.30 per cwt. and 5c per point above 3.5%. Feed prices: corn and cob meal, $11.50 per ton; ground oats, $23; bran, $40; oil meal, $48; cottonseed meal, $46; alfalfa, $25; clover, $20; silage, $8.

West Bend, Wisconsin:—January market milk sold for $2.40 per cwt. The condensery paid 50c and the creamery 51c per pound for fat. The cheese factory paid 60c per pound. Milk retails for 9—10c per quart, butter for 56c per pound; and cheese for 30c per pound. Feed prices are: barley, 90c per bushel; oats, 50c; corn, 70c; bran, $31 per ton; middlings, $34; oil meal, $48; gluten, $55; silage, $7; alfalfa hay, $30; clover, $28.

Rosendale—Eldorado, Wisconsin:—Two registered Holstein bulls were bought during January and four unprofitable cows were sold. One carload of bran was bought at $32 and another ordered at $23.50 per ton. Feeds sold as follows: oats, $25; corn, $28; bran, $30 to $35; oil meal, $44.75 to $50.

Eureka, Wisconsin:—Four per cent market milk sold for $2.00 in January, 20c being deducted per cwt. for hauling. The creamery paid 55c per pound for fat. Feed prices are: ground oats, $30 per ton; ground corn, $26; oil meal, $60; brewers grains, $50.



Empire—Osceola, Wisconsin:—Several members are now feeding balanced rations and reporting good results. Most of the feed is purchased co-operatively. Three registered bull calves have been sold by two members. The condensery paid 50c and the cheese factory paid 53c per pound for fat. Butter retails for 50c per pound. Feeds sold as follows: silage, $8 per ton; alfalfa hay, $20; clover hay, $20; bran, $34; oil meal, $50; corn and cob meal, $20; oats, $28; barley, $34.

North Crandon, Wisconsin:—One pure-bred Guernsey bull was purchased in January. Members are feeding for better production on fresh cows. Expect to have a few cows that will make R. O. P. records. The creamery paid 46c and the cheese factory 46c per pound for fat. Milk retails for 10c per quart, butter for 52c per pound, and cheese for 35c per pound. Feed prices are: oil meal, $60—$70 per ton; corn, $38; bran, $36—$42; middlings, $38; Dairy Ration, $50—$60; clover hay, $24; timothy, $20—$26; oats, $30; peas, $60.

Prince William, Virginia:—Three slackers were found during January and sold. More than one herd in this association could afford to sell sev-

(Continued on page 380)

"Bettering the Best"

A NEW pulsator on the Empire Milking Machine—the *only* pulsator backed by a 4-year guarantee—that spells opportunity.

A 4-year guarantee by a firm of such reliability as the Empire Cream Separator Company speaks volumes. It's the strongest possible service insurance. It will make the present dominating position of the Empire Milking Machine still stronger.

This new Empire Pulsator is simple and self-contained—practically impossible to damage. It is a remarkable assembly of mechanical principles which have proved their worth. Two traps make it absolutely sanitary—no milk can get into the Piston chamber—no slop, dirt or oil can get into the milk pail. The Pulsator can be removed from the lid in a second. It is so constructed that even with a change in vacuum within the operating range, *there is no change in the speed of the pulsator.* That means uniform action and no half delivered "squeezes" and "releases."

The Empire has established the economy and reliability of machine milking. Everywhere all over the world today men have come to realize the necessity for conserving human labor—cutting down the hours per day so that a man can live a longer life of usefulness.

Over a million cows are milked twice daily by Empires. Thousands upon thousands of installations are in use from Maine to California. Empire Milking Machines have earned for themselves an impregnable reputation for service and satisfaction.

The 4-year guarantee which goes with every Empire Pulsator is one evidence of the extent to which we stand squarely back of the Empire Milking Machine. You owe it to yourself and to your dairy profits to investigate the Empire Milker at once. Write for catalog 1-M.

THE WORLD'S CHAMPION YEARLY MILK COW (37,384 LBS. MILK IN ONE YEAR). HER SON WILL BE SOLD IN THIS SALE

A WORLD'S RECORD YEARLING AND HER SON

SADIE GERBEN HENGERVELD DE KOL, WISCONSIN'S 40-LB. COW. (SEE HER TWO SONS IN THE SALE).

A 35-LB. COW. (785 LBS. MILK).

A BLUE RIBBON COW FROM THE PACIFIC COAST

Note the following wonderful Bulls—

1.—Carnation Segis Prospect, a 2-yr.-old, Prize-winning son of the world's champion milk cow, SEGIS PIETERTJE PROSPECT, whose recently completed record is 37,384 lbs. milk, 1,445 lbs. butter in one year. This bull is by DUTCHLAND GOVERNOR SIR COLANTHA 90477, a son of the great milk sire, COLANTHA JOHANNA LAD.
World's Record Bull

2.—King Fayne Segis of Nooksack, a yearling son of the world's champion yearling heifer for 7 days' milk and yearly milk and butter. His dam, NOOKSACK JEWEL FAYNE, (see her in the Sale) has a 7-day record of 627 lbs. milk in 7 days; 23,100 lbs. milk, close to 900 lbs. butter, in a year.
World's Record Bull

3.—Sir Model Sylvia, an 11-month-old son of CHAMPION ECHO SYLVIA PONTIAC and BELLE MODEL PONTIAC, a beautiful show cow with three 7-day records of 32 lbs., 33 lbs., and 37 lbs. butter. Her dam is a twice 37-lb. cow.

4.—King Valdessa Pontiac Tritomia, a son of the 40-lb. bull, KING VALDESSA PONTIAC from POLLY DOUGLAS FAYNE (see this splendid cow in Sale), a 32-lb. 4-yr.-old now making approximately 1,200 lbs. butter.

5.—A 4-month-old son of King of the Ormsbys from a 31-lb. 4-yr.-old.

6.—King Ormsby Bodo, a 6-month-old son of KING OF THE ORMSBYS from a 26-lb. 4-yr.-old which made 892 butter, 19,753 milk in a year.

7.—A Son of King Ona Pontiac (best son of Ohio's only 30,000-lb. cow) from a junior 2-yr.-old with over 21,000 milk, 800 butter in a year.

8.—A 5-month-old Son of Dutchland Colantha Sir Inka (the greatest proven sire in the East) from K. K. S. V. TOPSY, the sensational 40-lb. 3-yr.-old.

9.—King Pontiac Segis Lad De Kol, a 15-month-old son of SADIE GERBEN HENGERVELD DE KOL, Wisconsin's first and only 40-lb. cow (782 lbs. milk in 7 days) and winner of first prize in Holstein-Friesian Association, 1919-20 with over 4,100 cows competing. This bull won second at the 1920 National Dairy Show in a class of 26 bulls, all ages. His dam, the first 40-lb. cow under new rulings of National Association.

10.—Sir Pontiac Gerben Hengerveld 262742, born Jan. 15, 1919. FULL BROTHER TO NO. 9. A splendid individual and worthy to head any herd in the country.

11.—A 9-month-old Son of the Famous Ormsby Korndyke Lad (14 daughters with records of over 1,000 lbs. butter in a year, 18 over 30 lbs. in 7 days). Dam of calf is CLARA MERCEDES PONTIAC (35.37 butter, 547 milk in 7 days at 3 years, 3 months).

12.—A 3-month-old son of Sir Echo Verbelle Segis (brother to MAY ECHO SYLVIA) from a 31-lb. show cow.

13.—A Son of Carnation King Sylvia (the $106,000 son of the famous MAY ECHO SYLVIA) from a 32-lb. dam.

14.—Toyon Chimacum Butter Boy, a yearling son of a 37-lb. bull from a dam which produced 21,567 milk, 904 butter as a 2-yr.-old and has just made another record of 1047 butter.

15.—King Posch, a yearling son of a 32-lb. bull from a 38-lb. daughter of King Segis Lyons.

16.—Sir Echo Sylvia Canary, a 2-yr.-old son of CHAMPION ECHO SYLVIA PONTIAC from the great show cow, ALICE TENSEN, with over 30 lbs. butter, 825 lbs. milk in 7 days. The two nearest dams of this bull average 870 lbs. milk in 7 days.

17.—The Splendid Proven Sire—King Walker Johanna Lad, who ranked fifth among all the leading sires of the breed for the year 1919-20. A blue ribbon bull with only 17 tested daughters (they average over 19 lbs. as 2-yr.-olds) and more than 60 yet to be tested.

18.—The Richly Bred Proven Sire, Finderne King Fayne Segis, weighing 2,200 lbs. Thirteen A. R. O. daughters. A sire of choice individuals. (See his four daughters in the Sale).

tional Brentwood Sale will be held

Exhibition March 28th

The Prize-List (at the Exhibition) includes:

$1,000 FOR BEST FEMALE Offered by Corn Exchange National Bank of Philadelphia

$1,600 in addition to be given in various classes—Heifers and Cows (in milk and dry) WITH $500 FOR BEST BULL (any age).

A 37-LB. SHOW COW, DAM OF SIR MODEL SYLVIA, THE 11-MONTH-OLD SON OF CHAMPION ECHO SYLVIA PONTIAC

A Few of the Leading Female Entries —

Two daughters of Carnation King Sylvia, one bred to CARNATION SEGIS PROSPECT (son of the world's record yearly milk cow).

Two Daughters of Ormsby Korndyke Lad (14 daughters over 1,000 lbs. butter in a year), one from a 32-lb. dam.

Five Daughters of Matador Segis Walker, bred to CARNATION KING SYLVIA, the $106,000 bull.

The World's Record Yearling Heifer—NOOKSACK JEWEL FAYNE (627 lbs. milk in 7 days, over 23,000 lbs. in a year, almost 900 lbs. butter.

Otego Valley Christmas Belle, a splendid individual with several A. R. O. records (including one of over 40 lbs. butter in 7 days). Bred to KING ECHO SYLVIA JOHANNA 203054.

A 30-lb. Daughter of King Lyons from a 31-lb. dam.

Two Great Producing Daughters of Colantha Johanna Lad 8th, one with over 32 lbs. butter in 7 days; the other has just made 35.12 lbs. butter from 785 lbs. milk in 7 days and 143.75 lbs. butter, 2,949 milk in 30 days. The average of these two cows for 7 days milk is 809.5 lbs.

A Wonderful Daughter of King of The Ormsbys from O. K. L. Royal Beets, whose 7-day record is 35.33 butter, 809.9 milk and 1,208 butter, 28,084 milk in 365 days. She is American champion milk producer (in her class) for 7 and 30 days. The averages for this calf's two nearest dams are: 7 days, 36.8 butter, 800.9 milk; 365 days, 1,250 lbs. butter, 26,500 lbs. milk.

Two Beautiful 32-lb. Cows (one with over 1,200 lbs. butter in a year) bred to ECHO KING SYLVIA (son of May Echo Sylvia).

A Daughter of Adirondac Wietske Dairymaid (over 800 lbs. milk in 7 days and over 31,800 lbs. in a year; 1,296 butter). Heifer is a show animal and by King Segis Alcartra Prilly, one of the greatest show bulls of the breed.

Hazelwood Ormsby Posch 2d, first prize cow at the 1920 Pacific International and winner of many grand championships and blue ribbons.

Four Daughters of the 35-lb. Bull, Finderne King Fayne Segis. A 30-lb. 4-yr.-old bred to King Walker Johanna Lad. A 21-lb. Daughter of a 35-lb. cow which produced 841 lbs. milk in 7 days bred to Model Darius Glista. Daughters of King Model. Three Splendid Heifers Bred to Ormsby Segis Lad 234065. DAUGHTERS OF KING SEGIS PONTIAC KONIGEN, DUTCHLAND CREAMELLE KORNDYKE LAD, WINTERTHUR KORNDYKE ORMSBY, FISHKILL ORMSBY JANE KING, SIR PONTIAC HET LOO, TIDY ABBEKERK KING, SIR AAGGIE MEAD DE KOL, KING SEGIS ALCARTRA SPOFFORD, and many other leading bulls.

A Very Choice Daughter of Champion Echo Sylvia Pontiac from a 27-lb. senior yearling.

Katy Pietertje Paul 5th, a wonderful 34-lb. cow which made over 31 lbs. butter from 703 lbs. milk at 10 yrs. of age. Now milking 100 lbs. per day.

A 3-yr.-old heifer which made over 20,000 lbs. milk, 813 butter as a 2-yr.-old.

Three Yearling Daughters of King Sadie Vale Hengerveld from A. R. O. dams.

Aurora Fayne Fobes De Kol 3d, a 4-yr.-old with 31 lbs. at 3 yrs. and 26,500 milk, 1,170 butter in a year.

Canary Oak De Kol 3d, a 3-yr.-old with a 2-yr.-old record of 23,000 lbs. milk, 900 butter in a year.

Three Fine Heifers Bred to C. E. S. P. Waldorf Pietje Clyde 266174.

Two Daughters of Spring Farm King.

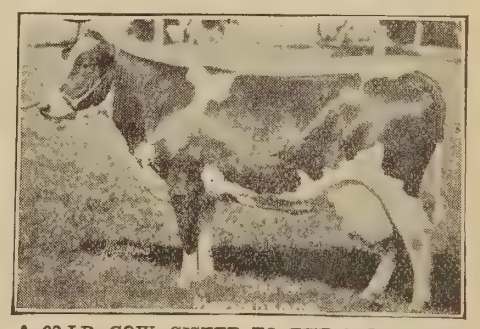
A Daughter of Korndyke Abbekerk from an A. R. O. Show Cow.

A Yearling Daughter of King Korndyke Sadie Vale.

A 35-lb. cow with records of 31.22 lbs. at 4 yrs., 32.08 lbs. at 5 yrs., and 35.37 lbs. at 6 yrs. (19,509 milk, 934 butter in 305 days).

A Daughter of V. P. I. Korndyke Veeman from a junior 2-yr.-old which made 16,209 milk, 598 butter.

Two Splendid Daughters King Tweede Spring Farm 212246 from A. R. O. dams.



Two Very Fine Daughters Dutchland Colantha Mona Lad 90476, one a 24-lb. cow with three other A. R. O. records.

Cow Testing Associations

(Continued from page 376)

eral of the poor cows and make more profit out of the remaining cows than they are doing at present. One member has recently finished a new 36x40 foot barn in addition to his present one of the same size. Both barns are equipped with individual drinking cups for cows and electric lights and are strictly modern in every way.

Wilton, Wisconsin:—A pure-bred Jersey bull of high breeding has been purchased by two farmers for their herds. A pure-bred Holstein yearling bull was purchased by a member who disposed of his grade bull at the association's scrub bull funeral last fall. Dairymen received 60c per pound for fat at the creamery in February. Feed prices: oats, 40c per bushel; corn, $1.17 per cwt.; bran, $1.40; oil meal, $2.25; silage at auction, $2 per ton; silage (home), $8; mixed hay, $16—$22; alfalfa (shipped in), $23—$30.

In basketball the "pure-breds" won from the "scrubs", score 22—12. One herd was fed pure ground flaxseed and this has very evidently been responsible for the herd average test increasing 2% butterfat. Pure flax was fed in place of oil meal for six weeks in a mixture of 100 lbs. flax, 100 lbs. bran, 100 lbs. oats, 100 lbs. corn, and 50 lbs. barley, in addition to corn silage and clover and mixed hay. If others would quote their experiences in feeding pure ground flax, we of this association would appreciate it, as it seems to have given us fine results so far.

Jo Daviess County No. 2, Illinois:—Twenty of the 149 cows tested in February were unprofitable. Twenty-two cows freshened, two of which died. Ten females and one grade bull were sold. Three pure-bred and two grade females were purchased. This association will reorganize April 1st. February market milk testing 3.6% sold for $2.50 per cwt. and 4c per point above. Feed prices are: silage, 40c per cwt.; bran, $1.70, corn, $1.40; oats, $1.65; barley, $1.50; oil meal, $2.45; middlings, $1.60; cottonseed meal, $2.40; molasses feed, $1.70; mixed hay, $1.25; wild hay, $1.20; Cow Chow, $2.80; Big Q, $2.75.

Lake County, Illinois:—One herd was tested for tuberculosis during February. Half of the members milked their herds three times daily and seven kept daily milk records. L. J. Hutchings' herd held first place for the third month in succession. February market milk testing 3.5% sold for $2.35 per cwt. and 4c per point above. The creamery paid 48c to 52c per pound for fat. Feed prices are: silage, $8 per ton; hay, $20—$24; corn stover, $6; corn and cob meal, $20; ground oats, $27; wheat bran, $34; oil meal, $48; cottonseed meal, $42.

Newport County, Rhode Island:—Rating plan goes into effect February 1st with producers of the Co-operative Dairy, and some of the unprofitable cows are being sold to cut down the surplus milk. Farmers' Exchange supplies a large number of producers in the county. This exchange is about a year and a half old and in flourishing condition. Milk will be bought on a weight and test basis beginning March 1st by our dairymen's association. February market milk sold for $4.63 per cwt. Milk retails for 17c per quart. Feed prices are: corn meal, $1.61 per cwt.; middlings, $1.84; cottonseed meal, $2.13; ground oats, $1.91; bran, $1.89; oil meal, $2.48; silage, $8 per ton.

Western Allegan, Michigan:—The association year ended January 27th. The average production for the entire association was 6,500 lbs. milk containing 288 lbs. fat. The herd with the highest average production, 387.1 lbs. fat in 10,559 lbs. milk, is owned by F. T. Lane. The high cow, a Jersey owned by J. D. Wedge, produced 522.8 lbs. fat in 8,220 lbs. milk. F. T. Lane owns the second highest fat producer, a Holstein whose record is 479.4 lbs. fat in 10,715 lbs. milk. Four more cows in his Holstein herd head the list as milk producers, the best record being 12,362 lbs. During the year two members purchased three silos, three pure-bred bulls were purchased, one member installed drinking cups, another put in a cement floor and piped in water; ten cows were sold as unprofitable and a number of others are being held for better prices as beef. Several improvements in feeding methods were noted.

Ohio Valley, Ohio:—February was the association's third month, and fine progress in better feeding is shown. Some herds have doubled their profit. A few more members are needed to make the association as a whole show up well.

First Kane County, Illinois:—Four pure-bred bulls and seven females have been purchased during February. A carload of bran and one of oil meal have been bought co-operatively. One member has begun Register of Merit work and will confine his efforts to long time tests. The number of cows tested now exceeds any previous number in this association. Market milk testing 3.5% sold for $2.35 per cwt. and 4c per point above.

Davenport, Iowa:—Six unprofitable producers were sold for beef during February. Three per cent market milk sold for 30c per gallon. The creamery paid 50c per pound for fat. Milk retails for 12½c per quart, butter for 48c per pound. Feed prices are: corn, 50c per bushel; oats, 48c; cottonseed meal, $42.50 per ton; bran, $40; oil meal, $50.

Orleans Co-operative, Indiana:—The average cost of producing one pound of butterfat in this association during the month of February was 33⅓ cents. One pure-bred sire was purchased this month. Three per cent market milk sold for $4 per cwt. The condensery paid 69c and the creamery 55c per pound for fat. Milk retails for 15c per quart and butter for 45c per pound. Feed prices are: corn and cob meal, $19 per ton; ground corn, $21; bran, $30; ground oats, $33; cottonseed meal, $36; oil meal, $42; alfalfa hay, $28; clover hay, $25; corn silage, $8.

First Tioga Dairy Improvement Association, New York:—Every herd in the association is headed by a pure-bred bull and every member is feeding a good balanced and economical ration. Some of the members have organized and are buying feed through the G. L. F. Exchange. During January 18 unprofitable cows were sold. Every member is a strong supporter of the Dairymen's League. A number of men have entered their herds for federal tuberculin test. January market milk testing 3% sold for $2.58 per cwt. and 4c per point above. Milk retails for 13c per quart, butter for 50c per pound; and cheese for 28c per pound. Feed prices are: silage, $6 per ton; mixed hay, $18; gluten, $42; bran, $35; oil meal, $45; cottonseed meal, $36; corn meal, $40; wheat feed, $40.

Juniata County, Pennsylvania:—At present there are ten members of our association signed up for the tuberculin test. After this test is run, it is hoped one or two bull associations will be started. Greater interest is being taken in the dairy business as a whole. January market milk sold for $2.75 per cwt. Feeds are rated as follows: silage, $6 per ton; hay, $20; corn stover, $8; corn and cob meal, $32.60; ground oats, $35.20; bran, $40—$45; cottonseed meal, $48—$55; oil meal, $50; Peerless Dairy Feed, $68.

PRINCESS MERCEDES SEGIS, A FIVE-YEAR-OLD HOLSTEIN OWNED BY PURDUE UNIVERSITY, INDIANA

In seven days she has made 539.1 lbs. milk containing fat equivalent to 29.829 lbs. of 80 per cent butter. As a three-year-old she made in 305 days 11,795 lbs. milk, 360 lbs. fat.

West Branch, Pennsylvania:—Six cows were sold during January, not as unprofitable, but to increase herd production. Four per cent market milk sold for $2.40 per cwt. and 4c per point above. Milk retails for 10c per quart and butter for 45c per pound. Feed prices are as follows: corn and cob meal, $24 per ton; ground oats, $30; cottonseed meal, $58; linseed oil meal, $58; wheat bran, $40; corn stover, 5c bundle; mixed hay, $20 per ton; silage, $6.

Laurel Hill, Pennsylvania:—Six unprofitable cows were sold during February. January market milk testing 3% sold for $3.13 per cwt. and 4c per point above. The creamery paid 68c per pound for fat. Feeds sold as follows: corn meal, $2 per cwt.; ground oats, $1.85; cottonseed meal, $2.70; Red Brand Tioga Dairy Feed, $2.75; gluten, $2.80; bran, $2.65; buckwheat, $2.60; oil meal, $2.65.

Wyalusing, Pennsylvania:—The association completed its year's work in February. Enough members were secured to start the new year without any loss of time. The highest individual was a pure-bred Holstein owned by C. W. Newman, which produced 689.7 lbs. of butterfat and over 17,000 lbs. of milk. This record

exceeds the previous highest association record for the county, which was 660.9 lbs. butterfat, held by a pure-bred Jersey owned by M. A. Taylor.

Rock Prairie, Wisconsin:—Two herds were tuberculin tested during February and six cows condemned. Six herds are on official test. February market milk testing 3.5% sold for $2.35 per cwt. and 4c per point above. Milk retails for 13c per quart, butter for 53c per pound, and cheese for 35—40c per pound. Bran is rated at $28 per ton; oil meal, $50; cottonseed meal, $50; oats, $30; corn, $18.

Amherst—Nelsonville, Wisconsin:—Four cows were sold for beef during February. More members have installed drinking cups and one has installed a milking machine. Balanced rations are fed by most members.

Wausau—Marathon, Wisconsin:—Ten per cent of the cows tested in January entered the 40-lb. class, as compared with six per cent for December. Three months ago the owner of the high cow hired an experienced herdsman. The profit from his herd of 30 cows has increased approximately 70 per cent in three months, four of the cows entering the 40-lb. list and three of them making the highest records for the month. One pure-bred Holstein bull was purchased during the month, and two carloads of alfalfa were bought. Three cows were sold for beef and one for dairy purposes. Four per cent market milk sold for $2.20 per cwt. and 5½c per point above. The creamery paid 54c and the cheese factory 52c per pound for fat. Milk retails for 10—14c per quart, butter for 45c per pound, and cheese for 32c per pound. Feed prices are: mixed hay, $23 per ton; silage, $6; bran, $28; middlings, $28; corn meal, $32; hominy, $32; linseed meal, $48; oats, 47c per bushel; barley, 80c; cottonseed meal, $54 per ton; alfalfa, $29; Wisconsin Balanced Ration, $42.

Wood County No. 2, Wisconsin:—Increased use of concentrates has greatly increased production of all herds. A survey shows 34 herds using pure-bred sires and four using grades. Milk retails for 10c per quart and butter for 50c per pound. The condensery paid 50c, the creamery 46c, and the cheese factories 51—57.5c per pound for fat during January. Feed prices are: cottonseed meal, $40 per ton; oil meal, $45; pure bran, $26; oats, $30; corn, $25; alfalfa, $30; timothy and clover, $16—$18.

We Know Our Cows

In May, 1917, I joined the Cedar Grove Association and at the end of the year's work I found that 12 of my cows had finished with an average of 252 pounds of fat. Although no boarders were present, the record was nothing to feel giddy about and I resolved to try again. At the end of the following year's work I found that 12 of my cows had finished with 302 pounds of fat on the average, which I thought a pretty good gain over the year before. By that time the Cedar Grove Association had grown unwieldy and was split into two associations. We commenced the third year's work in the Oostburg Association in July, 1919, and found at the close of the year that 11 of my cows had averaged 356 pounds of fat.

The above gains from year to year were made with ordinary cows, under very ordinary conditions, and with a shortage of labor. This can be duplicated by many farmers by following the tester's advice and directions more closely.

Wisconsin. G. LAARMAN.

FARM HELP

If you want information about Farm Help that will increase your yield and cut your production costs down to where you are sure of a good profit, send for this booklet.

Use the coupon above—or a postal card will do. The new 1921 Twin City 12-20 Tractor Book has the Twin City Record on Fuel Economy—showing its average of 45¾ cents an acre—the lowest.

In brief easy-reading form it gives you details about the Twin City 16 valve-in-head engine which, by thorough combustion on kerosene, delivers more than 25% beyond its rated horse-power. It tells you about the high-grade alloy steels, heat treated, and all the features which make it the tractor that is

Built to do the work—not to meet a price

It contains illustrations from actual photographs of all kinds of farm work with the 12-20—a money saver all the year around.

Write for the booklet. See your nearest Twin City dealer. Get the facts about Twin City organization for service in every section. A Twin City user writes: "The fact that my tractor is made by a big company is worth the price again. I never have any trouble getting service."

The full Twin City line includes Tractors, All-Steel Threshers, Motor Trucks. Catalogs on request.

Which Tuberculin Test?

HOARD'S DAIRYMAN:—On page 90 of your issue of Hoard's Dairyman for February 4th, 1921, you compare the intradermal and subcutaneous methods of tuberculin testing. You only give the result of the post mortems on reacting animals. Nothing whatever is said about the failure of the subcutaneous test to eliminate from the herd those animals that have the disease extensively generalized and that frequently fail to react to this test, but that in some cases at least will react to the intradermal. The chief objection to the subcutaneous test in the past has been the fact that it left in the herd diseased animals that fail to react, which led to discrediting the breeder who sold such animals that were later found to have the disease.

In a recent series of tests in our vicinity of the animals that reacted to the intradermal and ophthalmic tests, only 75 per cent reacted to the subcutaneous. As these animals have not been slaughtered, we cannot yet be certain what the post mortems would show, but, if we assume that all that reacted to the intradermal and ophthalmic tests were diseased, then the subcutaneous test was only 75 per cent accurate. This is about what the most careful statistics demonstrate it to have been as used in the past.

The writer believes that the use of the intradermal and ophthalmic methods will result in taking out of the herd at the first test a much larger percentage of the diseased animals than the subcutaneous, and that these two tests show much greater hope in the future of maintaining clean herds than by the use of the subcutaneous test. Perhaps it is too early yet to arrive at definite conclusions as to the efficiency of the two latter tests.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Exchanging the Old for the New

Spring was beginning to put in its appearances. Everything emphasized this fact. The red breasts were to be seen at nearly every hour of the day, merrily chirping their best to attract a mate for the season. The willows had already been robbed of their pussies, for the younger Greenes had carried them by the armfuls to their teachers. The air was soft and balmy and the cattle in the yards lowed plaintively as they daily raised their heads and sniffed to catch the first breath of the growing green. The sky grew bluer each day and the sun climbing higher and higher radiated its warmth to old mother earth in such generous portions that dormancy was giving way to new life everywhere. Indeed spring was here, accompanied by the activity of every rural household. The new routine was again established and Jerry Greene found himself working just a little longer each day in order to keep ahead of the work which was now beginning to crowd all the members of the Greene family.

It was on one of these days in early spring when one is really made to realize that it is good to be alive and to have good health that Jerry watched his father carefully spading a piece of sod along the old garden fence, a thing which he had seen from the time he first toddled about the yard.

"I hope that you are not going to do that same old stunt, dad," he finally broke forth. "It doesn't get at what you want to know anyway and wouldn't Jimmy be disgusted if he could see you right now, and I don't know but what I am about as disgusted as he would be. There's no use, dad, sticking to the old ways when there is something better. I'll take care of the seed corn testing this spring, dad," and he reached to take the spade from his father's hands.

"This way's just as good as any," answered the father. "I've growed corn more years than you are old, boy, and I hain't never failed to get a crop yet. And what's more I've tested my seed corn like this every year. Your grand dad taught me that and if it was good enough for him, then it is good enough for me," he breathed hard as he jabbed the spade vigorously into the soft, moist turf. "There's too many of them new fangled notions going 'round about the best ways to farm and the very ones to start them are those who hain't had no experience at the game. I'll take my lessons first hand, and it's my opinion that if them college perfessurs would teach the boys down there at school the things we learn from the experiences of others, they might do something worth while," and he pulled just a little harder than usual on the black clay pipe as he stopped his work and looked up at his son.

"Just what they are doing, dad; teaching their experiences and they ought to know because that's what we pay them for; to find out the things that we haven't time for and even if we had, we wouldn't know how to go about their job. Their training fits them for their jobs and it is a silly notion that just because they are not farming, they cannot do some things for us. I know that I can't talk the way Jim can about these things, but it is just as plain to me as if I had the education that Jim is getting. I for one want to see this old place run in an up-to-date way, and we are cutting off our own pleasures if we don't pay attention to the best things that we are paying for. There is a better way to test seed than you have practiced all these years and because you always cure your seed corn in the worst way possible it is all the more reason that we should test it in the best way. You boast about always having a corn crop, but you don't know though what you are losing by not knowing the kind of seed you plant. This much is certain; you have never yet defeated Bob's father in corn yields. He proves that every year and his soil isn't any better than ours either and I don't think that Bob ever cultivates their corn as much as Jim and I do ours. I've been thinking about this for a long time and the only way that I can figure it out is that they plant better seed than we do. I've always noticed this and that is they take just as good care of their seed corn as they do of their cattle and you don't catch them curing their seed corn on the windmill frame and under the porch. Anyway if I was ma, you wouldn't decorate the front porch every fall with stringers of corn. Last spring after the corn was all up, Jim and I noticed that ours didn't look like Ramsey's. Theirs came up quicker and thicker and it kept ahead of ours all summer, too. And one day when we were talking about it, Bob said that it was all in the kind of seed they used. That set me to thinking and now I'm ready to do the job right."

"Getting as bad as Jim, Jerry," his father answered. "He was always giving advice where it wasn't wanted and I don't know as it ever got him anywhere."

"Got him in the agricultural college," Jerry smiled, "and you just watch him make good, too."

"Bob says lots of things," continued the father as he started for the house with the long strip of sod under his arm. "I don't believe all the stuff I hear; I want to see it proved first, and don't you forget, Jerry, that I'm an old hand at growing corn and them fellers that talks that stuff you believe are white collared farmers," and he almost snickered at the point he thought he had scored.

"Dad, I don't believe you know what I am driving at," retorted Jerry.

"Indeed I do, and there's one thing sure, you and Jim will drive me crazy with your fool notions if you keep this up about everything that I do. I'm running this place and until it is turned over to you boys, I intend to do so. After that you can do as you want to, and that settles it."

By this time they had reached the house and Pat Greene carefully laid the strip of sod on the stone door step while Jerry looked on, a dry smile playing about the corners of his mouth. Suddenly he broke forth with, "Dad, you remind me of a story that the fellow who bought my last sow last fall told me when he was here. You remember him, don't you? That tall, good natured looking fellow who came all the way from Oxford just to buy one of my famous Durocs that you said I couldn't make any money from? Well, I did make money and you know it, too. But what I was going to say was this, the story he told me. A nigger preacher in Detroit was letting loose to his congregation one Sunday about how the Israelites walked across the Red Sea. And he said, 'Bred'rn, I'se knowed dis to be a fact all my life, but 'til I'se libbed in dis heah city, it's always been a mattah ob faith wid me. Now I sees de reason for it all. When dem Israelites did dat walking, de sea was froze over and dey just natu'lly walked across on de ice. You see bred'rn, dat's all very simple when you got de experience to back yeh!

"Just as he concluded, a young colored youth flashily dressed and fresh from college arose in his pew and said, 'Mistah Reve'nd Johnson, how could dat be when de Red Sea am down near de equator and dere ain't nebber been no ice down dere. You'se got de wrong explanation for dat miracle, Mistah Preachah!'

" 'Ladies and Gen'men,' " shouted the preacher, 'Dis heah young sprig of a niggah hain't telling no truth. Jus cause he's ben away to college and got his head stuffed wid a lot of fool notions of dem college professahs, he thinks he knows more'n de ol folks an de teachings of de good book. And I want to say, ladies and gen'men, dat I has de right explanation for dat miracle for in dem days when de Israelites did dis walking, dere was no equator. Now I leave it to your good jedgment, bred'rn, who is right?' "

Dad Greene looked up with a dry grin decorating his homely pug face. "Pretty good story, Jed, and I suppose you think that I am like the old darkey preacher."

"That's what I told the story for, dad. You're the 'show-me-kind' and I'm going to show you this time, dad. I got ready for you last fall at seed picking time and now we want to learn the truth about the whole matter and I'm just as ready to learn as you should be. And now we are both ready for the lesson or experiment, I guess Jimmy would call it. First of all we must size up the situation as it has been for the past about our seed corn."

"Well, as usual, I presume you will have to have your own way about the matter," replied the father, "but I think I shall test a little of the seed in the same way I always have just to make myself believe that the job has been done and I guess I'll feel better about it, too. Now, what did you do to get ready for this experiment as you are calling it, son?"

"It wasn't much, dad, but I guess it will prove our point just the same. I took about 25 ears last fall and hung them in my room upstairs to dry out. You know that the kitchen chimney leads through there and so there is plenty of heat to dry seed corn quite fast. Every day I examined it and then compared it with yours hanging under the porch and what I found out at that time makes me very anxious to carry out this trial that you have agreed to. Yours was three times as long in drying as mine was and if there is any truth in what we hear nowadays about curing seed corn, mine should be the strongest seed. But I'm here to learn too. Jimmy told me the last time he was home that it isn't only important how much seed grows but how strong it grows. I never thought about that before as simple as it sounds and I guess you didn't either, dad. Anyway we will have some satisfaction from this deal.

"Now, this is what I want to do, dad. I will test 25 ears of your seed right along side of my 25 ears, doing all for the one what is done for the other. In this way we will be able to make a fair comparison of the results."

"Well, there isn't very much time to waste, son, for corn planting will soon be upon us, so we had better get the seed down and shell it."

"All but 25 ears, dad, remember that."

It took but little time to run the ears through the sheller and as Jerry turned the crank he smiled to himself as he noted some of the dark, musty looking cobs bobbing out of the hole. "That's what he gets for curing his seed corn on the outside," he thought to himself. "You can't expect to get strong seed from such ears and I'll just bet that I can predict what the results of the experiment will be." With the shelling completed, Pat Greene took a handful of kernels from the sack and scattered them over one-half of the strip of sod and after wetting it, he folded over the other half and carried it into the kitchen where he placed it under the kitchen range, to remain there for the next six or eight days. In the meantime, Jerry prepared a rag doll test and proceeded to carry out his plans.

"Now you see, dad," he explained, as he worked with his father looking on, "that my way has an advantage over yours. If any of the kernels fail to grow or if they don't produce good strong plants, I'll know just

(Continued on page 388)

THE STORY OF THE RAG DOLL
Set me to work and I'll tell you the truth about your seed corn.

No Sale? Why?

WAS it because the fertilizers offered were not like those he formerly used?

Was it because they were not rightly balanced?

Was the price too high?

Was the farmer doing some thinking about the relation between the soil and crop requirements and the composition of the fertilizer offered?

Was he in doubt whether the fertilizer offered is the kind that will give him the best profit consistent with maintaining or increasing the productiveness of his land?

If he did not think about these things he should have done so.

The values of farm crops have fallen more rapidly than the cost of farm supplies or of farm labor.

To meet these conditions, the cost of producing a unit of crop must be reduced. Here fertilizers help. But for the best return the plant foods in them must be of the right kinds, in the right forms, in the right amounts, used in the right way, at the right time.

How is one to know about all these?

It is not an easy problem to solve. Yet many farmers are making very good progress on it. They know that the best results do not come from increasing the proportion of the plant food used in the least amount by the crop and reducing the proportion of the plant foods used in the largest amount by the crop. The exigencies of the war period caused just such a reversal in fertilizer formulas, but there is now no reason for continuing it.

All the plant foods are now obtainable in such quantities as to justify farmers in insisting on getting what they think will prove most profitable to them.

Spring crops use from two to ten times as much Potash as Phosphoric Acid. Is it unreasonable to use a fertilizer containing at least as much Potash as Phosphoric Acid, especially after five years of Potash starvation? Years ago the profits from fertilizers containing more Potash than Phosphoric Acid proved that

Your Assurance of Quality

Many things you buy reveal readily by their looks unmistakable evidence of quality or lack of it. But surface appearance alone fails to disclose sound value or long life in a ready-roofing. That is why the man who wants dependability in ready-roofing looks for the name Ruberoid. That word alone is his absolute assurance of high quality.

Ruberoid Roll Roofing is scarcely affected by the wear and tear of the elements. It has lasted on thousands of buildings, without repairs, for over a quarter century.

The Ruberoid Distributor near you will prove to be the leading hardware or building supply dealer in your community. Consult him about Ruberoid.

New State Record Jersey

J. C. ALLEN, INDIANA

PURDUE'S Golden Estella, nine years old, a pure-bred Jersey cow in the dairy herd at Purdue University, is the new champion butterfat producer of her breed in Indiana, winning this honor when she completed a year's record which showed 14,101 pounds of milk and 752.35 pounds of butterfat or nearly 900 pounds of butter. This mark established a new Jersey record for the state, and also one of the best in the United States.

The champion cow is remarkable as a producer. She was bred and raised on the University farm so that her records are complete in every detail. One of her daughters as a two-year-old produced more than 500 pounds of butterfat and this year in the three-year-old class promises to make another record for three-year-old Jerseys. All her female offspring have been high producers and the bull calves have grown into valuable sires.

Her daily ration consists of 25 pounds of silage, 14 pounds of alfalfa hay, and about 12 pounds of grain or concentrate mixture which includes ground corn, ground oats, bran, oil meal, and cottonseed meal. Last fall she also received a good feed of beets each day. Despite this high record and the rearing of a calf, the champion cow has come through the year in good condition and is in better flesh than when she started the test last February.

"This shows what can be done with a good pure-bred cow properly handled," said Professor L. H. Fairchild, of the dairy staff. "She is of good breeding, is a good individual, and she has been fed the best we know how. She is a splendid eater and appreciates good attention, as is shown by her record."

PURDUE'S GOLDEN ESTELLA

Cheese Factories to Pay by Test

HOARD'S DAIRYMAN:—The days of the old pooling systems at cheese factories seem to be numbered. Some years ago a Dairy Standards Act was placed on the Provincial Statute Books of Ontario, providing that milk at cheese factories must be paid for either on a straight fat test or fat test with two per cent added as a casein allowance. Opposition developed and the Act was never enforced. This winter the Act has been endorsed by both the Eastern and Western Ontario Dairymen's Associations and by so many local meetings, that it will probably be brought into action this coming season. One of the strong arguments used against the Act in the past has been that tests could not be relied upon. Since then the Cream and Milk Tests Inspection Act has been brought into force and already inspectors are on the road, checking up the tests made by creamery operators. In the past season only three convictions were made, two for underreading the test and one for overreading it. In the latter case, it was assumed that the creameryman, who was just starting business, was trying to attract patronage and would make up for his generosity (?) later on. These inspectors would also be available to check up on cheese factory tests.

A little incident happened at the Finch Dairy Station, which illustrates the essential selfishness of those who support the pooling system for the division of cheese factory proceeds. Milk had been paid for on a straight fat basis at this station for one year. About half the patrons then petitioned the Department to go back to the pooling system. Probably they were the half who had gotten under the average for their milk. Instead, the station superintendent announced that milk would be received at one weighing-in platform by the pooling plan, and at the other on test. The cheese would be made up separately and the proceeds kept separately. When the morning arrived for the inauguration of the new plan there was not a can of milk turned in at the pooling platform. The dairymen producing poor milk had no use for the pooling system unless it enabled them to share in the proceeds that rightly belonged to their neighbors who were producing a higher testing milk.

Cheese Boards Passing

Some months ago I told readers of Hoard's Dairyman of how cheese factory patrons in Eastern Ontario had gotten together and organized a co-operative company known as the United Dairymen Co-operative, for the sale of their cheese. The factories belonging to this new company ship their cheese to Montreal, where it is graded by an official of the Department of Agriculture, and sold at auction according to its grade. This method is designed to do away with the local cheese boards which have been subject to many abuses. During its first season the company did a business of $1,000,000 and this winter

organization work is being pushed so vigorously that in the coming season several times as much cheese may be handled as in 1920. The Ontario dairymen got their idea from the creamerymen of Saskatchewan, who organized the Saskatchewan Co-operative Creameries Limited. From a report just to hand I learn that in its third year, just concluded, this western concern ran 23 creameries, five cold storage plants, three poultry killing stations, supplied Regina with milk and cream, made 161,000 gallons of ice cream, 3,000,000 pounds of butter, marketed 50 carloads of eggs, and has fixed assets of $900,000. This concern is right in the home of the greatest co-operative grain handling company in the world and the dairymen evidently do not intend to be outdone by their grain growing neighbors in co-operative development.

Dairy Production for 1920

The value of dairy products produced in Ontario last year is estimated at $100,164,500. Of this the cheese industry is responsible for $25,440,000; creameries, $21,175,000; condenseries, etc., $10,000,000; ice cream, milk, buttermilk, cream, etc., $11,000,000; and farm dairy butter and milk used on farms, $33,000,000. The dairy industry is in a thriving and healthy conditio .

Canada. F. E. ELLIS.

Cocoanut Oil Takes Place of Dairy Products

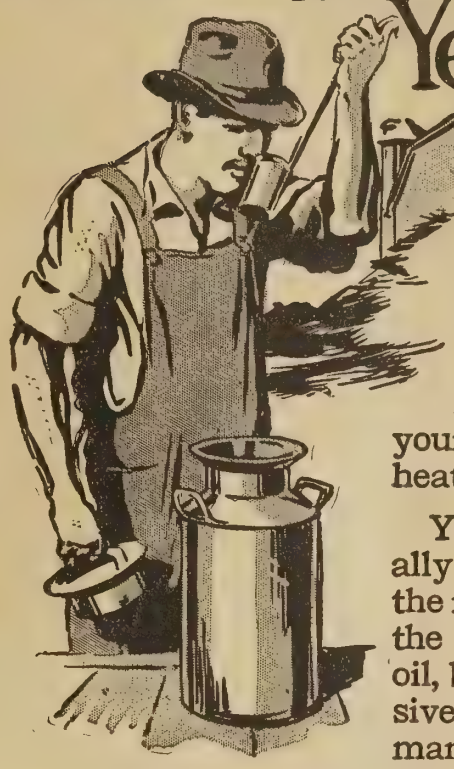
"Too much cocoanut oil in competition with butterfat is the trouble with the dairy industry, today," says K. L. Hatch of the College of Agriculture, at the University of Wisconsin. "Before 1915, we were importing milk products, and the percentage of imports was increasing. After 1915, we were exporting and have continued to do so up to the present time, although a relatively small portion of the total milk production goes into the export trade. How does it happen that we could turn so quickly from an importing to an exporting nation? It has been due, not to an overproduction of dairy products, but to the increase in cocoanut oil imports," explains Mr. Hatch. "This is the way it began. As the war came on, we were urged to use substitutes. Then when prices kept soaring, we naturally sought something cheaper, until, in 1918 and 1919, butter substitutes were replacing 5,000,000,000, pounds of whole milk in the United States. This was three times the amount of condensed milk exports.

"What are we going to do about it?" asks Mr. Hatch. "It may be that time will take care of the matter, for we are not importing quite so much cocoanut oil this year as last. The surest way, however, to boost dairying and save the situation is for the farmer to use more butter and milk on his table, to feed more milk on the farm, to do away with the 'boarder' cows, to advertise his milk products, and not to buy condenseries on a glutted market."

That the use of butter substitutes by the American people is the real cause of the dairy situation, and not the importation of butter from foreign countries, as many believe, is the statement of more than one good authority. "While the arrival in our markets of butter from Denmark and New Zealand is bound to have a depressing influence," states B. H. Hibbard of the Agricultural Economics Department, "there is no cause for real alarm. These countries are too small to make a great impression on our trade."

One solution, which Mr. Hatch suggests, is to increase the use of butter and discourage the use of inferior substitutes. The growth of the demand for substitutes is far larger than most dairymen realize. In a canvass of five leading grocery stores in the city of Madison, Wisconsin, it has been found that the average amount of substitutes sold, both vegetable and animal, is more than double the amount of butter. The only store visited from which a greater percentage of butter is sold has many Jewish customers whose religion will allow them to take no chances in eating butter substitutes made of unknown fats. The farmers, themselves, the grocers say, are bringing in butter to sell and taking away oleo for use in their own homes.

The little town of Darien, down in Walworth County, has the one cow testing association in the state of Wisconsin, whose members, all farmers, use no oleomargarine on their tables. "We want to use this as a nucleus from which to start a 'Use More Butter' campaign all over the state," says A. J. Cramer, state leader of cow testing associations. "It all came about through the efforts of one live man, George Moss, tester of the Darien Association. About eight months ago, as he went around from farm to farm, helping the members in their feeding problems and improved methods of dairying, Mr. Moss noticed that, in many of the homes, oleo was used on the tables. He at once decided to start a campaign and began by tactfully refusing to eat the oleo offered in the homes of the members.



"'Here,' he said, 'you folks are complaining of the price you are getting for your butterfat, and you don't eat butter yourselves. How do you expect other folks to buy it?'"

The members took it up among themselves and, with the help of Mr. Moss, carried the campaign into Darien and other nearby towns, until, today, the association members' tables are 100% free from oleomargarine, and the grocers of Darien are selling only one-half as much butter substitute as before.

Encourage boys and girls to save money for a definite goal—for a better education, and for the start in life on the farm or in business. The older members of the family can make it easier for the boys and girls to save.

Untempered Oil Is Like Yesterday's Cream

YOU don't have to go farther than your own milk-house for a big pointer on oil values.

Notice your cream. Just as it has its limit period of sweetness, your motor oil has its dead line of heat endurance.

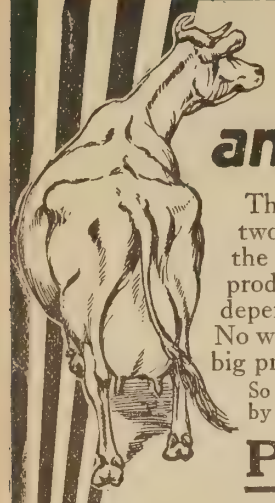
Yesterday's cream may not actually be spoiled, but you know it's on the road. Its life is limited. And in the same way, ordinary untempered oil, bruised out of petroleum by abusive processes of overheating during manufacture, is crowded close to the breakdown point before you get it.

The resistance you need against motor heat is partly sapped—its full endurance is cut down in the wrong place.

In the Wasteless Easy-Pouring Top Tip Can

Wadhams *Tempered* **Motor Oil**

If Tempered Oil and untempered oil could be dissected to show their real structure, you would get a comparison similar to the views above—one, unbroken, firmly knit, ready for its duty, the other shattered to the verge of breakdown — pre-crumbled by abusive uncontrolled heating in manufacture.



is at its prime when you get it. It is made by the perfected Tempering process. Destructive pre-heating is avoided. The full heat resistance and lubricating qualities of its materials are kept intact. It lasts longer and does better work because all its good goes into your motor.

When you buy oil, go to the dealer who displays the Wadhams sign. He carries the grade of Tempered oil scientifically correct for your car and for your tractor.

Wadhams Oil Company *"Emphatically Independent"* **Milwaukee**

S. S. CRAMER, President.

"*Tempered*=an oil QUALITY—not just a brand name"

Cow Health and Your Wealth

There is a mighty close connection between the two. Your income—*your wealth*—depends upon the amount of milk and butter-fat your herd produces. And heavy, profitable production depends upon the *health* and *vigor* of each cow. No weak, sickly, run-down cow can be either a big producer or a good breeder.

So put your entire herd in the big-producing class by using

Pratts Cow Tonic

the dependable, tested regulator and digestive tonic. It makes inferior cows good producers—it makes good cows better producers. All because it *naturally* tones up the whole system—helps strengthen and invigorate the organs of digestion and milk production. The result is a bigger flow of richer milk—*more profit.*

And healthy cows are better breeders, too, producing the strong calves that are worth growing. So there's a double reason for regularly using Pratts Cow Tonic.

Successful, progressive dairymen everywhere are using Pratts Cow Tonic because they have found *it pays.* Prove its value in *your own herd.* Make the test, then

Exchanging the Old for the New

(Continued from page 382)

where to look for them and can throw out the ears from which they come. You can't claim that for yours and so the bad kernels from such ears get planted with the rest. That, of course, reduces the stand of plants that you will get and it is common sense to believe that the yield will also be reduced some. Good seed is the beginning of every successful crop. I'm almost ready to say that I'll bet you a new hat that the seed from the ears I cured in the house will prove to be lots stronger than yours. And what simpler test do you want than this? Easy to perform and it can't help but be accurate," he added as he rolled up the tester and tossed it into a bucket of water to soak for a few hours. "I'll leave it there until we come from the field tonight and then I'll drain it and set it away for six or eight days the same as yours."

Each day seemed to add its toll of interest to the experiment as Jerry carefully moistened his tester each evening after the day's work was done. The entire family now considered it a part of their business and each evening the younger members of the household begged Jerry to open the tester for they were sure it was ready. But Jerry always laughingly put them off saying, "a scientist must be patient if he expects to get good results." Even the father now seemed to enjoy the trial in which he found himself one of those concerned and when the evening came upon which they had agreed to open their testers, it found all on hand to learn the lesson.

The sod tester was the first to be opened. "Pretty good seed I should say," remarked the father as he looked at it with approval. "There aren't many that haven't grown."

"Well, let's see about that, dad," broke in Jerry observing it critically. "I've already counted ten and there are some more too and the worst of it is, you don't know from what ears those dead kernels came. And since your seed is all shelled how could you possibly locate them if you wanted to? "Yes," he added, "the others don't look any too strong either. I think you are taking too many chances in planting seed like this. Well, perhaps mine won't be much better and then you'll have the laugh on me," he remarked proceeding to unfold his rag doll tester.

It was an interesting and instructive lesson that Jerry's tester taught, as the reading of it proceeded. There were weak sprouting kernels and dead kernels, but upon examination each set of such seeds were directly referred to the ears of corn he had taken from his father's seed. Every square of kernels coming from the ears he had cured the way seed corn should be cured made a most excellent showing and taught the lesson which Jerry had set out to teach.

"It sure is a lesson to me about seed corn," spoke up Jerry's father, "and I think I'll go over to Ramsey's tomorrow morning to see if he can spare me some of his better seed. I'll be taking too many chances if I plant this stuff."

"Yes, dad, and I want you to notice how much stronger the sprouts are on my plants than they were on yours. That's because my seed had more vigor than yours had and it's all in the way the ears were cured. How about them college ideas now, dad?" he slyly asked. "Not so bad after all, are they?"

The Acid Test for Good Seed

The acid test for good seed corn is the germination test. Believe it or not, it is true and every good corn grower will agree with this statement. The indifferent attitude which you may have about applying it does not alter the case in the least and, remember this, no one but yourself is the loser. Pat Greene's method of testing can tell you some things and may be all right to apply for a general test when you are pretty certain that you have taken excellent care of your seed, but in those cases where seed corn is purchased or where you are not certain about the way the corn cured out, then we would recommend the individual ear test. It is too unsafe to rely upon eye examination of the ears as to the quality of seeds which they carry. It is nonsense, Juniors, to enter a corn production contest without knowing just what kind of seed you are planting. Most Juniors who grow corn in the contest work do so upon an acre basis. Now it is a small matter to test 15 or 20 ears, the number required to plant an acre, and it is a very important matter just the same.

It makes little difference as to what method of germination testing is used, providing the test you adopt is properly applied. That is the important feature. It is unnecessary to describe the kinds of tests, because all are so common that any farm boy knows how to perform them. Seed corn that does not grow from 95% to 100% strong is unsafe to plant if you are in the contest business. Many of the Juniors interested in seeing how much corn they can grow on an acre, test their seed corn at school as a part of their agricultural class work. Maybe you can do the same and perhaps by talking with your teacher about it, a seed corn testing club can be formed and all of the corn can be tested by the club members. The time is here when you will want to know how your seed will act when it is planted in the soil, and if you are a real live corn grower, we are sure that you will not slight this very important operation.

Junior Letters

Hoard's Dairyman Juniors:—I like your paper very much. I read the junior letters and stories. I never knew what a good paper Hoard's Dairyman was until two years ago when I joined the judging contest at the Wayne County Fair. We each received a paper and I chose Hoard's Dairyman. I won second place in the contest and last year I won third place. We have a farm bureau and a fine county agent. With the money I got for second prize I got a high grade Holstein calf. Later I bought a pure-bred calf. The grade's name is Whiteface and the pure-bred's name is Countess De Kol Pontiac Girl. They are a little over a year old now. We have 14 pure-bred Holsteins and 7 grades. We bought a pure-bred Holstein bull last winter but he died. Now we have a male calf about five months old.

Pennsylvania. Alice Curtis.

Hoard's Dairyman Juniors:—My sister and I joined the Boys' and Girls' Calf Club and besides caring for this calf I must go four miles to school. Our calves are Holsteins and mine weighs 250 lbs. I give it four quarts of sweet milk twice a day, also a mixture of four pounds of ground oats, ground barley, bran, and oil meal twice a day.

I received my fob, button, and creed and I was delighted to get them. I think they are great in getting the boys and girls interested in good farming. I live on a 60-acre farm and we are preparing to build a new house in the spring. I am ten years old and in the fourth grade. I would be very glad if some of the juniors would write to me. Wishing all the juniors good luck.

Wisconsin. George B. Paltzer.

Hoard's Dairyman Juniors:—I have a heifer calf that my father gave to me. She is a high grade calf. We have a cow that gave 45 lbs. She is the best grade cow we have. My cow is doing pretty well; so is my calf. My calf has quite a lot of white in her. Her mother gave 50 lbs. a day. My father swapped a bull calf for her for me. I have been going to school all this week. I am still milking the four cows. We are milking 11 cows altogether. It has been raining a little and the climate is just like March. My father has bought him a calf. She cost $15. If any of the juniors will write to me I will answer their letters. My address is Dexter, Maine. Horace Hopkins

Guernsey Enthusiasm in Yakima

HOARD'S DAIRYMAN:—With a record of twelve new pure-bred Guernsey herds started in the Yakima Valley within the past year, and an exceedingly optimistic outlook for the rapid development of the Guernsey breed in that section, the Yakima Valley Guernsey Breeders' Association held a very enthusiastic session at its second annual meeting recently.

In his address President H. E. Angel reviewed the work of the association to date and called attention to the marked progress of the Guernsey breed in the valley, largely due to the fine co-operative spirit of the association members. He spoke of the twelve new herds started in the valley, and of the steady upbuilding and high standards characteristic of the Guernsey breeders of the district. He urged even greater activity for the coming year and stressed the importance of more publicity for the Guernsey breed in the valley.

County Agent Coglin spoke on the value of a balanced ration and the best feeds for Yakima Valley herds. An interesting talk was made by A. L. Wallace who gave some illuminating side lights on the Pacific International Live Stock Exposition at Portland. President Haigman of Washington State College spoke on the growing of feeds; F. A. Majenski gave some practical advice on how Guernseys may be kept as a profitable side issue on a Yakima orchard tract. Other speakers were President Hayton of the state farm bureau and C. A. Peabody.

The following were elected officers for the coming year: President, H. E. Angel; vice-president, A. L. Wallace; secretary and treasurer, R. N. West. Members of executive committee are J. B. Vance and C. A. Peabody.

The association voted to offer two silver cups at the Oregon State Fair next fall. The members were entertained by the Commercial Hotel at luncheon.

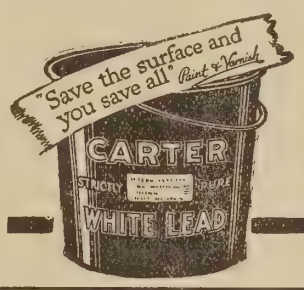
Paint Prices Reduced!

Go to the Carter White Lead dealer in your vicinity and ask the price of

12½ lbs. CARTER WHITE LEAD.
⅔ gal. Linseed Oil.

You will then have this season's reduced cost of a full gallon of the purest and best white paint that money can buy.

For first coat, add a pint of Turpentine.



To make colored paint, the tinting colors will cost a little extra.

For large jobs, 100-lb. kegs of Carter White Lead are more economical.

You will then be able to estimate closely the cost of any needed painting and it will total much less than you think—only a small percentage of the replacement value of the buildings it will save from decay.

You can't escape the cost of needed painting. You can only choose whether you will pay for the painting or stand a greater loss through damage to your buildings—the damage resulting from unchecked decay and rot.

Another suggestion: The demand for CARTER WHITE LEAD was never so great as it is this season. The supply is large, but not unlimited. If you get yours now you will not be forced to accept a substitute nor put off painting until your dealer can get it for you.

Get ready *now* for Spring painting.

CARTER WHITE LEAD CO.
Made in Chicago, Ill.
Sold nearly everywhere.

"Perhaps You Don't Know"

The Pabst 2nd Semi-Annual Sale

Buy Your Herd Bull — or Some Foundation Cows There

Some of the Bulls—

1—PABST KORNDYKE CREATOR, a Creator son from a 25-lb. sister to a 35-lb. cow. This dam has produced a 29-lb. daughter and her own dam has 26 lbs.

2—PABST PONTIAC CREATOR, a Creator son from a 22-lb. junior 3-year-old daughter of King Pontiac Champion. Her dam is a half sister to a 39-lb. cow.

3—PABST CREATOR ACHILLES, a Creator son from a 29-lb. and yearly record daughter of King Pontiac Champion. Dam has 898 lbs. butter from over 20,000 lbs. milk. Her dam also has a yearly record of over 800 lbs. Third dam has a yearly record of almost 900 lbs. His five nearest dams average over 1,000 lbs. butter. A great bull.

4—PABST CREATOR MODEL, a Creator son from a sister to three cows with records of 1,000 to 1,200 lbs. in a year. Dam has 600 lbs. milk and 27 lbs. butter and also has a splendid ten-month record.

5—PABST CREATOR ELDER, a Creator son from a 29-lb. Champion dam. Her dam has 31 lbs. in 7 days and 1,050 lbs. in a year. A splendid calf.

6—PABST KING PONTIAC LAD 43D, a grandson of King Pontiac Champion and a 39-lb. cow. Dam is a sister to Pabst Korndyke Cornflower, a 38-lb. 3-year-old that sold for $30,000. Second dam is a 35-lb. daughter of Champion, third dam a 29-lb. 3-year-old.

7—PABST CREATOR DUKE, a Creator son from a junior 3-year-old with 21 lbs., she a full sister to a 29-lb. cow with almost 900 lbs. in a year. Second and third dams have 800 lbs. butter in a year and 27 lbs. in 7 days. His own dam is on yearly test and doing well.

8—PABST CREATOR CYNTHIA, a Creator son from a 23-lb. junior 4-year-old, her dam the highest record daughter of King Pontiac Champion with 38 lbs., third dam a 29-lb. cow. A calf of rare breeding.

9—BORN DECEMBER 16, 1920, a Creator son from Pabst Champion Dora Korndyke. This means the two grandams of this bull are Champion Dora Korndyke and Spring Brook Bess Burke 2d that together have seven 1,000-lb. yearly records. The dam has just made 21.88 lbs. butter as a 2-year-old and is on yearly test. This bull comes from one of the best combinations of breeding and high records in our herd. He is an exceptional calf.

10—PABST CREATOR IVY, a Creator son from a 34-lb. dam with a ten-month record of over 80 lbs. butter. She has produced a 32-lb. daughter and is a maternal sister to a 1,100-lb. cow with almost 26,000 lbs. milk.

11—BORN DECEMBER 25, 1920, a Creator son from Pabst Kinnickinnic with three records above 32 lbs., one above 35 lbs. A sure 1,000-lb. prospect. The two nearest dams of this calf now average over 1,100 lbs. with the dam's record at ten months.

—And a line up on the Cows

They will include several daughters of King Pontiac Champion, a few of them in calf to Creator, also several sisters to Pabst Korndyke Cornflower that sold for $30,000 at St. Paul. There will also be some daughters of Maplecrest King De Kol and Woodcrest Clyde. One of these heifers is from a 31-lb. dam with 1,050 lbs. in a year. Another by Maplecrest King De Kol is from a 29-lb. daughter of King Pontiac Champion. This cow has a yearly record of over 800 lbs. and in calf to a three-fourths brother to Pabst Korndyke Cornflower.

PABST SALE
SURPLUS ANIMALS
APRIL 2nd

¶ 29 Young Bulls
¶ 15 Young Cows
¶ 15 Sons of Creator
¶ 16 Sons of Yearly Record Dams
¶ 7 Cows Bred to Creator
¶ Several Daughters of King Pontiac Champion
¶ Practically every animal bred, born and raised here.

The bulls in this sale are the surplus of our herd since our sale last October. They include the very best we have ever bred. You come to this sale and buy at your own bid the result of fifteen years of constructive breeding. In instances we own the dam, the grandam and the great grandams of these bulls. You see them for yourself, you know what you buy.

Last year Pabst Stock Farms won first place as breeders of prize winners. This means that her animals make good. For those who want to start with foundation animals we say come to this sale. In our last sale 39 bulls went to head different herds. Send now for the advanced sale list and make your plans to attend.

DAIRY DEPARTMENT,
University of Tennessee, Knoxville, Tennessee

Washington Holstein Breeders Organize

HOARD'S DAIRYMAN:—A movement for the closer organization of Holstein breeders of Washington which started about the time of the state fair of 1920 culminated March 1 in the first annual meeting at Seattle of the Washington State Holstein-Friesian Association, Inc., a going concern with a membership representing about one-third of the pure-bred black and whites in the state; with a paid field secretary; and with $5,000 in the treasury.

Early in January, President D. D. Aitken of the Holstein-Friesian Association of America arrived in Washington to make a two weeks' tour of the state in the interest of the association's membership campaign, and the executive committee appointed Stanley V. Butchart, a young breeder of Sunnyside, temporary executive secretary to accompany Mr. Aitken and to work on membership and organization until the annual meeting.

Local clubs have been organized in fourteen different counties in the state, some of them including more than one county, but all of them conforming to the requirements of the state and national associations for affiliation therewith. They were all represented at the recent meeting, by from one to seven delegates each, the total of 49 delegates indicating a total membership of about 225, one delegate being allowed for each five members, or major fraction thereof, in good standing.

President F. S. Stimson was unanimously re-elected, as were Vice-president H. C. Davis of Granger, and Treasurer R. L. Rutter, Jr., of Ellensburg. The following men were elected to the board of directors which will handle the affairs of the association when it is not in session: Dr. H. K. Stockwell, H. A. Shoultes, Alex Todd, J. L. Smith, T. G. Lockhart, William Bishop, and T. J. Owens. The president is ex-officio member of this board, which decided to continue Secretary Butchart in office for the coming year. He will be on salary and will spend all of his time looking after the business of the association under the direction of the board.

A sales committee consisting of J. L. Smith, William Bishop, A. M. Ghormley, Ed. Hoem, and Alex Todd was appointed to have general supervision of sales which will be held under state association auspices, and at once made arrangements to handle the first under these auspices, the dispersal sale of Van Woerden & Acheson at Mt. Vernon, April 9. The committee is charged with enforcing the requirements for the dispersal, consignment, breeders' and guarantee sales which the association will hold, and its membership is well scattered over the state to facilitate inspection of animals intended for these sales.

A committee on claims and adjustments, consisting of George Gue, W. B. Auld, and Mr. Smith was appointed. To this committee will be submitted all claims arising from sales, regarding non-delivery of papers, tubercular reaction, non-breeders, etc., and members have entered a "gentlemen's agreement" to abide by the decisions of this committee as final. It is hoped to unite the consignments from Washington herds to the National sale at Syracuse this year into one association consignment, and some work is planned in connection with the fall fairs, though the activities of the association will be limited until it is on a sound financial basis.

Permanent membership in the association costs $5, whether the member is an owner of cattle or merely

interested in the dairy industry. Annual dues are assessed against each owner member, on the basis of 20 cents per head for each grade female over one year old in his herd; and $1 per head for each pure-bred male or female one year old or over, when the herd consists of not more than 24 head; $1.50 per head if the herd consists of any number from 25 to 49, inclusive; $2 per head from 50 to 99; and $3 per head from 100 or more. This sliding scale was adopted at the suggestion of the larger breeders, though their pocketbooks are most affected, in order to insure a large membership of men handling small herds.

Only a little over 4 per cent of all the pure-bred Holsteins in the country are on the Pacific coast, a recent census shows, and Washington has only about 4,500 of them. Some remarkable records have been made by Washington cows, however, several world records having been broken within the past year, and breeders of the Evergreen State are ahead of the backers of all other breeds in their efforts at organization. Both Guernsey and Jersey breeders have state associations; there is a Guernsey field man at work in a territory which includes several western states; and the appointment of a western Jersey field man is being considered; but the Holstein breeders of Washington are the first to have a state field man, and with his help they expect to put the state association in a class which the excellence of their cattle warrants.

Washington. CHAS. N. ANGELL.

Michigan Cream Pools

Co-operative cream pools for Michigan dairymen as the first step toward improving the dairy products of Michigan were urged by the Committee of Fifteen on dairy affairs in Michigan, meeting March 3rd in Lansing.

The committee adopted a resolution recommending "that the dairy department of the Michigan State Farm Bureau promote and assist in establishing such cream pools in the various dairy communities of the state for the purpose of collective marketing on a quality basis of the cream produced by the dairymen of a given community."

The Committee of Fifteen, comprised of five leading milk producers, five co-operative creamery men, and five farm bureau dairy authorities, met to devise some means to pull the dairy industry of Michigan out of the chaos which is said to exist in that state. It was agreed that immediate improvement of the quality of cream marketed by the dairy farmer must precede all other steps for betterment of the farmers' lot.

Committeemen agreed that poor butter, not oleomargarine, was the dairy farmer's worst enemy and that the gradual deterioration of creamery butter throughout the country was due to the cream station system, where the same price is often paid for both poor and a high quality cream, thereby removing any financial incentive for the farmer to produce a better product, according to the farm bureau.

"No educational campaign to improve dairy products in Michigan or in any other state will work," said H. C. Wendt, chief of the dairy division of the Michigan State Food and Drug Department, "unless it is accompanied by a universal system of grading cream that will make a substantial difference in the price paid for a poor and a high quality product." The committee agreed that Mr. Wendt's statement pointed the way for proposed reforms in Michigan dairy practice.—Michigan State Farm Bureau.

PORTER
"Dependable Since Sixty-Eight"
Money-Making Cost-Cutting Labor-Saving Barn Equipment

Some Exclusive Porter Advantages You Will Want in the Barn Equipment You Buy

¶ The "little things" about your barn equipment installation often prove most important in point of continuous, satisfactory service. A stanchion latch, a track coupling or a drinking bowl connection may seem insignificant in itself. If it is right you never give it a thought. But if it is wrong it causes endless inconvenience and annoyance. The Porter line is characterized by a careful regard for important details. Here, for example, are a few of the valuable features to be found only in Porter Products:

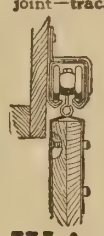

Fig. 15—Stanchion—with Cow-Proof Latch

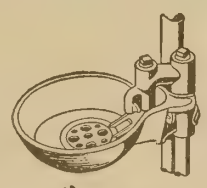
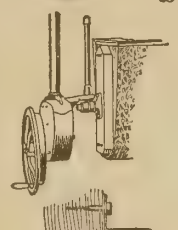
¶ The craftiest old cow in your herd can't work this combination—two latches that must be squeezed at once, like the handles of a pair of pliers. Easy for the human hand but absolutely proof against horns. That's just one outstanding feature of this Porter single-chain-hung swinging stanchion. Interesting folder on request.



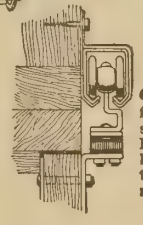
Columbian Double-Bead Steel Track

¶ All Porter litter carriers, feed carriers and hay carriers operate on this sturdy, one-piece track. Strongest built—carries 3000 pounds safely. Two set screws in the track coupling fit into notches in ends of track and make a tight joint—track can't pull apart.



"Double-V"—A Better Barn Door Hanger

¶ The "Double-V" tread is an exclusive Porter principle, which reduces friction to the minimum and makes the track wheels run true. Roller bearing four-wheel trucks run smoothly and easily. Track is storm-proof, trash-proof and trouble-proof; keeps the trolleys dry and free from rust.



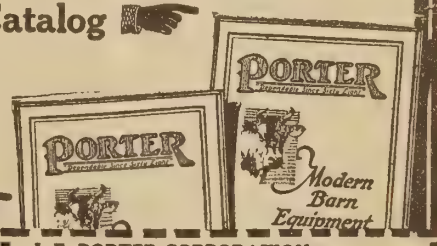
A Drinking Bowl That Won't "Wobble"

¶ There's a lot of satisfaction in a stall post connection that enables you to remove or replace each drinking bowl in an instant, yet holds it so firmly that it becomes a part of the stall when the connection has dropped in place. That's a Porter improvement—one of several distinctive features in this excellent automatic drinking bowl.

Porter "Geared" Hoist Litter Carrier

¶ The geared hoist principle is found only in Porter Carriers. It is remarkably simple and so designed that it combines power with speed in raising the loaded tub. Entire mechanism enclosed. We also make a chain-lift carrier.

"Straight-Away" Garage Door Set



¶ The offset swivel eliminates the necessity for a curved track and lets the door fit snugly into the door opening—an exclusive Porter feature. Complete set, track, hangers, hinges, handles, latches and screws, comes to you in a single package—at a very moderate cost. It's worth investigating.

Write for The New Porter General Catalog

¶ It contains 144 pages of labor-saving, money-making barn equipment information and gives you all the latest developments in

Steel Stalls and Stanchions
Steel Animal Pens
Litter Carriers and Feed Carriers
Automatic Drinking Bowls
Barn Door and Garage Door Hangers
Hay Tools and Friction Hoists
Cupolas and Ventilators
Everything for the Barn

¶ We'll cheerfully mail you a copy postpaid on request.

Going to Build or Remodel? Get This Book

¶ A new Porter publication is now ready for the press—a book of valuable barn planning and barn construction information; treats the subjects of drainage, lighting, ventilation, roof construction and a score of other important subjects.

¶ Prepared by skilled architects. Just check coupon or give us your name and address on a post card and we'll send you one of the first copies off the press—without charge or obligation. WRITE!

To Lessen Loss of Cans

In an effort to lessen the losses of cans in the shipments of milk and cream in Ohio, a committee has been appointed which will seek to adjust complaints and to improve the service in returning cans to shippers. The committee appointed represents the Ohio Dairy Products Association and the several transportation lines on which milk and cream are shipped. A committee was appointed following a conference between representatives of the carriers and of the dairy association, following complaint filed by the Ohio Dairy Products Association before the Public Utilities Commission of Ohio against the Ohio carriers to require the issuing of waybills and receipts for shipments of milk and cream and the return of empty cans. The committee will hold regular meetings in different cities in the state and inspect the facilities for handling dairy products on the carriers to those cities. At these meetings the dairy interests in the localities are invited to attend the conference and to aid in correcting the evils of transportation service which are now alleged to exist.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Contagious Mammitis

Cows' udders often are permanently ruined for milk secretion by a malignant form of mammitis caused by germs and which tends to remain in a stable and infect cow after cow. Germs are the cause and the one most commonly to blame is the pus-forming micro-organism known as streptococcus. The disease is practically incurable and the infection is difficult to get rid of. Prevention, therefore, is of paramount importance.

There are several types of the disease, but an owner may take it for granted that the malady has invaded his herd when cases of incurable, destructive mammitis crop up one after another at every season of the year, but especially when the cows are stabled during the winter months. In one type of the disease boils form at the base of the teats and others follow when the first one has ruptured and healed. In some instances these boils do not at first cause any marked change in the consistency of the milk, but eventually the udder may become involved and lose its milk secreting function. It is much more common, however, for the disease to start from sores which form on the tips of the teats and interfere with milking. Scabs form on the sores over night and have to be picked off before starting to milk. This aggravates the condition and soon a milking tube is brought into service and unless the greatest possible care be taken scrupulously to cleanse and sterilize the instrument by boiling each time before use it will be certain to carry infection into the udder. That is indicated by a thickening of the mucous membrane lining the duct of the teat so that a hard core can be felt when the teat is rubbed between the fingers. When the disease infects the true mammary gland tissue (parenchyma) the condition corresponds to that present in a lung affected with pneumonia. Milk at once becomes whey-like and full of clots. Then pus forms and a muco-purulent fluid comes away, is brownish or even greenish in color and often has a foul odor. The gland tissue now loses its milk secreting function and tumor, scar, or cicatrical tissue gradually replaces gland tissue and may be felt as a hard lump. In many cases, however, abscesses form and discharge pus into the chambers and ducts of the udder or externally, and in some instances gangrene or death of the parts invaded results from the disease. This may quickly kill the cow or the affected part sloughs out, or has to be cut out by the surgeon. He may even find it advisable to amputate a quarter of the udder or the entire udder, that being a quite possible operation in such cases.

A severe attack of contagious mammitis is ushered in by all of the symptoms noted in our previous article on acute mammitis and treatment is practically the same as prescribed for that disease. The udder should be irrigated with a milk-warm 3 per cent solution of boric acid twice daily and milked out clean 15 minutes afterward. Campho-phenique should be rubbed in at first and mercurial ointment later. Treatment with mastitis bacterin should be given by the veterinarian. Affected cows must be isolated and the stables perfectly cleansed, disinfected, and whitewashed under supervision of the veterinarian, and should then be kept clean. Udders should be cleansed before milking with clean, dry hands, and where milking machines are used all parts must be sterilized after each milking. New bought cows should be quarantined until known to be free from disease.

Leaking Teats

Two years ago one of my heifers was troubled with an obstruction at the end of her teat. I opened it with a teat slitter and ever since when her udder fills up, it leaks steadily. Is there any known remedy for this?

Warren Ctr., Penn. F. R. P.

This trouble possibly may be remedied by immersing the teat for five minutes after each milking in a strong solution of alum. If not, then coat the end of the teat with melted wax or paraffin and if that fails, use flexible collodion.

Wart

1. Have a 2-year-old heifer that will calve in April. She has a very large wart on one of her teats. Is it possible to remove it before she makes much bag?

2. Have also a fresh cow, 8 years old, that has sort of a sack near or at the base of one teat and before beginning to milk it is hard but softens as I finish milking. It seems to be very sore of late as the calf sucks. Calf is three weeks old, but sack was there before she had this calf. It acts something like a rupture.

Wisconsin Rapids, Wis. G. W. A.

1. The wart may safely be snipped off with scissors if it has a narrow neck or will drop off after a time if tightly ligated with a fine cord. Rub the base lightly with a lunar caustic pencil if the wart starts growing again.

2. A little iodin ointment rubbed into the affected part of the teat every other day may prove beneficial, but a personal examination would be necessary to exact understanding of the condition present.

For Barrenness in Cows, Mares and Sows, Use Hood Farm Breeding Powder

Astonishing Success in Making Barren Animals Breed — Indispensable After Abortion — Invaluable Where Cows do not Clean — Profitable to use on Every Cow After Calving.

Read what they say:

Be Sure She Cleans

Retained afterbirth indicates a germ infection—that all your cows are likely to catch. Don't try to remove this afterbirth by the disagreeable hand method—the membranes are easily torn and further infected causing blood poisoning—besides you never get it all and serious results follow. B-K dissolves the adhesions, brings the afterbirth naturally, killing the germs and foul odors—no straining or irritation. B-K is much more effective and safer than Lugol's Solution carbolic acid, or coal tar disinfectants which do not cleanse the uterus but coagulate the matter and make the uterus more acid and irritated and are poisons. Do not be without B-K—You have in the one bottle—your protection against abortion—retained afterbirth—calf scours—always ready. Ask your dealer or write us for our booklet. Get a gallon—the standard Farm Package. If your dealer hasn't that size, have him get it for you.

Dr. Stattler's
STOP SCOUR

STOP YOUR GREATEST PIG, CALF AND COLT LOSSES

THERE isn't a man raising live stock who hasn't had big losses from Scours in pigs, calves, and colts. Now is the time to insure yourself against this greatest of the breeder's losses.
STOP SCOUR is not an experiment. It is not a theoretical formula prepared in an office for commercial purposes, but is the result of my many years actual practice of veterinary medicine.

INSURE THE COMING CROP
Give DR. STATTLER'S STOP SCOUR to your pregnant dams. Then give it to the offspring after it is born. Small doses will prevent Scours.

STOP SCOUR WILL CURE ANY CASE OF SCOURS WITHIN 12 TO 48 HOURS
STOP SCOUR is an absolute cure. If your pigs, or calves or colts are actually scouring, DR. STATTLER'S STOP SCOUR will cure the worst case. I have never lost a single case from Scours in my private practice.

STARVATION NOT NECESSARY
With DR. STATTLER'S STOP SCOUR, you don't have to reduce the ration. Feed just as usual.
DR. STATTLER'S STOP SCOUR is carried by your druggist or feed dealer. If he shouldn't have it, write us his name and address, and we'll see that you get it either through him or direct from us.

A POSITIVE GUARANTEE
STOP SCOUR is sold under a positive guarantee and the fulfilling of the guarantee is placed in the hands of the Exchange State Bank of Lanark, who agree to refund your money without question if you are not satisfied. You are doing business with an institution of known reliability.

Send No Money —We will send trial package C. O. D. Write us.

How, When, and What of Soy Beans

(Continued from page 359)

Other tests are to be carried on this coming season with several varieties of soy beans, finding out more concerning the merits of certain varieties for hay crops. A small stemmed leafy plant is desired for hay purposes and I am confident that so far our medium Wisconsin grown beans come as near filling that requirement as any outside grown bean, but as yet we don't raise enough seed of these varieties to supply the demand. Many farmers have used the Mammoth Yellow soy beans for hay with results not at all satisfying because of lack of pods and quite coarse stems, but in the absence of a supply of other earlier beans, these were the best that could be had and gave a large supply of forage.

Until just recently some of our seedsmen were unfamiliar with varieties of soy beans and were just as likely to send out Mammoth Yellows for Ito Sans as not, or a late black or brown for early ones, so farmers have found accidentally that there are some merits to the more southern grown beans in adverse dry years on very light soil, in that quite a tonnage of green feed could be produced even though the plant had not even blossomed. Most farmers, however, like to have some pods form on the plants by hay cutting season, so these extreme late varieties do not meet with favor as well as those that set pods quite heavily.

For Silage Crop

What has been said of soy beans as hay will nearly suffice for the silage crop. If the soys are planted with the corn crop a variety that will grow well up with the corn is desired, and the little black many times does this. However, most farmers prefer planting a later variety, as Ito Sans or others in that class for this purpose. On Mr. Ristow's farm no difference could be observed between Ito San, Black Eyebrows, and Manchus. When planted in corn they all stood up about thirty-four inches. Also at Green Lake, Ito Sans seemed about four feet high in the corn, but in Waukesha and Juneau Counties in trial tests the Black Eyebrow and Greens seem to be far ahead of the Ito Sans. In some counties the Mammoth Yellows have been very popular as a bean to plant with corn, and until we can get more of our standard varieties it may take a regular place in our silage system. In our variety tests, however, the Mammoth Yellow showed up about the poorest of any of our varieties, the Mongol, Ohio 9035, Greens, and Haberlandt all being much better, while the Wilson, Ebony, Virginia, and many others had large tonnage, but had poor standing qualities and lodged quite badly.

It may be the best practice to plant soy beans by themselves and mix with corn at time of putting in silo, but in case they are planted with corn a separate attachment can be used on the planter to plant the beans, dropping two to four in each hill, or they can be mixed with corn, in which event the driver must stop occasionally and thoroughly mix the beans and corn. If corn is drilled in, beans can be dropped about as often as the corn. In many cases where help is available the beans are planted directly beside the hill with a small hand planter, the planting being done about the time the corn is just coming up.

Wisconsin farmers are finding that on light soils soy beans are winners every time. They find that on heavy soils nothing can be lost by planting them in with their corn or in some of the timothy meadows so as to have some real hay. Soy beans are a new crop though and it is only by actual experience that the needs of the crop can be learned.

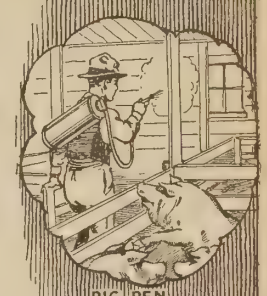
Delaware Holstein Breeders Meet

The second winter meeting of the Delaware Holstein-Friesian Association was held last month at Winterthur Farms. Professor R. E. Hunt of Virginia discussed the work which has been done in that state with Holsteins. Professor T. A. Baker of Delaware called attention to the leading families of Holsteins and indicated that all of the well known families are descended from some particularly noted individual. Dr. W. G. Middletown reported the progress of tuberculosis eradication in New Jersey. A resolution was adopted protesting against any change in the existing laws of the state which provide for indemnifying owners of animals reacting to the tuberculin test.

ALL AROUND THE FARM

Paints and also Disinfects Dries White

CARBOLA
The Disinfecting White Paint



Use It Instead of Whitewash or Whitewash and Disinfectants

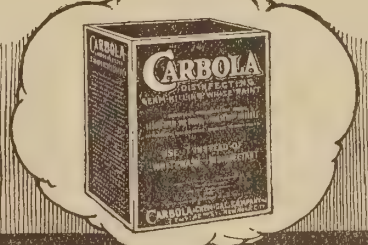
Your money back if you are not satisfied with the results Carbola gives. Thousands of dairy, breeding and poultry farms and many agricultural colleges and experiment stations use it regularly—re-order again and again. A trial will show you that it saves time, labor and money and gives better results.

Makes It Easier To Do Work That Must Be Done

Carbola is a paint and disinfectant combined, in powder form. To mix it you put some in a pail and stir in water—that's all. Without waiting or straining you have, in less than five minutes, a snow-white, smooth-flowing paint you can apply with brush or a spray-pump to wood, brick, stone, plaster-board, cement, tar-paper and *over* whitewash. It will not blister, flake, or peel off nor clog the sprayer. It does not spoil by standing—can be kept in powder form or mixed and left ready to use when wanted. One gallon (a pound of powder) will cover 200 square feet. The disinfectant used in Carbola is twenty times stronger than pure carbolic acid, but is neither poisonous nor caustic—harmless to the smallest chick or to stock that licks a painted surface.

As a Louse Powder

Carbola is unexcelled for use on poultry, cattle, horses, hogs, dogs, etc. Separate the hair or feathers and apply the dry powder directly on the flesh. Sprinkle in the nests, in the straw on the floor, and in the dust bath and wallow. It costs only 10c a pound and means comfort and better health for your stock. Order it now so you will have it on hand when you need it.



Your hardware, seed, drug or paint dealer has Carbola or can get it. If not, order direct. Prompt shipment by parcel post or express.

10 lbs. (10 gals.) $1.25 and postage. 20 lbs. (20 gals.) $2.50 delivered. 50 lbs. (50 gals.) $5.00 delivered.

Trial package and interesting booklet 30c post-paid. Also in barrels, about 300 lbs., at 9c a pound. Add 25% for Texas and Rocky Mountain States.

SCOTT'S SOY BEANS

We specialize in Soy Beans.

Soy Bean Hay is richer in protein than Alfalfa Hay. When planted with corn for silage, Soy Beans greatly increase the feeding value.

Soy Beans, when inoculated will store up as much as 125 pounds of Nitrogen per acre.

Other important facts about this valuable crop are to be found in **Scott's Field Seed Book** and **Scott's Soy Bean Catechism.**

"It Might Have Been"

HOARD'S DAIRYMAN:—Such were the feelings of all true Idahoans when the recent world's record of Segis Pietertje Prospect No. 221846 was announced. Not that we begrudged any praise to the cow herself or to Mr. Cockerell or to the Carnation Farms. All deserved great credit for the truly marvelous performance of the wonderful cow. Nevertheless the feeling of regret still remains and cannot be entirely downed for Segis Pietertje Prospect is an Idaho product. On the farm of George V. Leighton of Boise, Ida., on April 10, 1913, she first saw the light of day. Not only that, but to Mr. Leighton belongs the credit of breeding her. It was in his herd that King Segis 10th No. 71153, who bids fair to be hailed as one of the great Holstein sires, was used. This bull of good individuality and exceptional quality weighed well over a ton. More important than individuality of the bull, is the type that he impresses upon his offspring. In this regard, King Segis 10th was markedly successful, his daughters being of excellent quality, large, and milky. While unfortunately too many of his offspring have left Idaho there still remains a sprinkling. A son or two are in service, one at the head of the dairy herd at the Caldwell Substation of the University of Idaho has been very successful although only used on grade cows. At the University dairy herd at Moscow a double grandson, a son of Matador Segis Walker, perhaps the most famous son of King Segis 10th out of a daughter of King Segis 10th, was formerly in service and has left a very promising group of heifers which are now on official test.

There are always regrets in life and Idaho regrets that the record that will be heard around the world should not have been made in the state where the champion was bred. We take off our hats to Washington in the making of records, but you see we can still feel pride for our breeding makes it possible.

Idaho. H. P. DAVIS.

Recent Jersey Importations

B. H. Bull & Sons of Canada and W. R. Spann & Sons of New Jersey have recently received a consignment of 99 head of Jerseys from the Island of Jersey. Among those received by the Canadian farm was Jersey Volunteer, which won second on the Island of Jersey in 1920 with his progeny, being judged by five daughters in milk. Ten head of the Spann shipment are daughters of Golden Fern's Noble and seven others are daughters of Fern's Oxford Noble, making up some of the best specimens of the Noble family imported to the Spann Farm.

Uncle Ab says that the world would be about one hundred per cent better if the time spent in gossipin' were put on the readin' of good books.

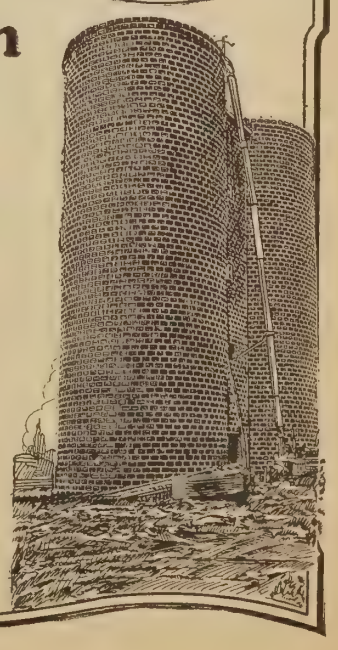
For Sale—260-acre stock farm, ideally located extensive buildings. Estate will consider renting for cash, or on shares to practical stock-breeder-farmer with herd, or means to join in purchase of.

Wanted—50 A. R. dairy cattle and 50 pure-bred milking Shorthorns or Herefords.

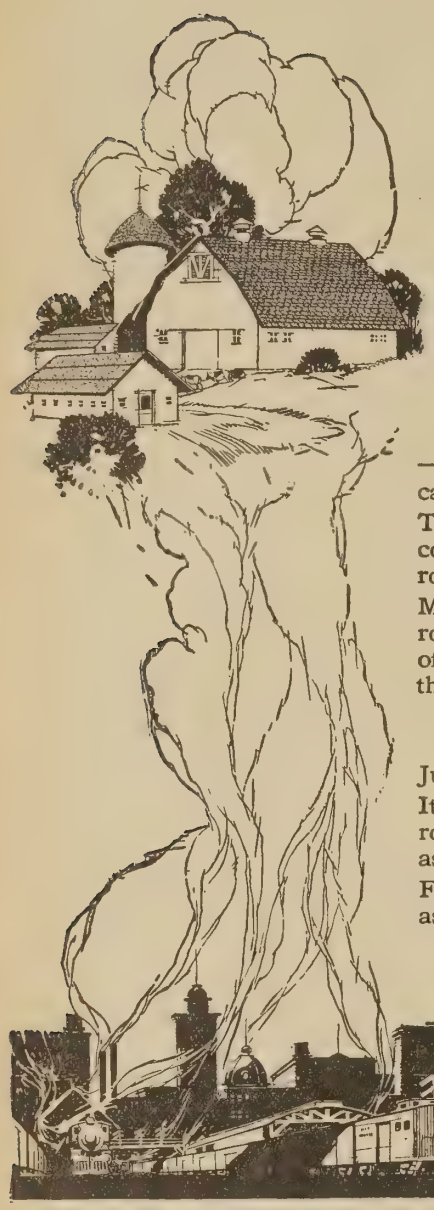
Will Sell—Mammoth bronze turkeys, vigorous wild strain foundation stock out-cross White-Leghorn (Super-Layers) poultry plant.

Address full particulars, references in first letter to ESTATE, Route 5, Box 100, West Allis, Wis.

Build Now-with DENISON



Mat Faced Hollow Building Tile



—and you'll have a permanent silo—one that can't blow down, buckle, warp, twist or collapse—one that gives you the utmost protection against fire, frost, storms and decay.

Your silo will be frost-proof. Dead air spaces prevent freezing through the body of the tiles. Insulating pads prevent freezing through the mortar joints—a patented feature of this Silo Tile. *Tile prices are down*—the supply is low—cars are available now—it's the best time to order. If you wait, you many not be able to get any this year. Write for further information. Denison Hollow Tile is sold by the best lumber dealers.

MULE-HIDE
"NOT A KICK IN A MILLION FEET"
ROOFING AND SHINGLES
Reg U.S. Pat Office

MULE-HIDE Roofing and the World's Greatest Railroad*

—"And after a field investigation by the Railroad engineers and master carpenters, MULE-HIDE Roofing was given a rating of 100%."

This rating was determined by a comparison of the service records and costs of three roofings which this Railroad designated as their "Class A" roofings. The wearing averages were 98%, 96%, and 94% respectively. MULE-HIDE with a wearing average of 96% ***cost 30% less*** than the roofing averaging 98%, and for this reason was given a combined rating of 100%—this after being in use for nearly fifteen years—again justifying that unusual service record—

"Not a Kick in a Million Feet"

Just what does this 100% rating mean to building owners the country over? It means there is available for the greater protection of their possessions a roofing so well made, so long lived, and at such a comparatively low cost as to practically place it in a class of its own.

For durability, for less cost per years of service, use MULE-HIDE, just as 90% of all Railroads entering Chicago use it year after year.

THE LEHON COMPANY, Mfrs.

Power and Production

(Continued from page 360)

in fact, negro labor is very often employed in a great many of the garages in that section of the country. The negro takes to machinery and enjoys working with it.

Every farm operation is a mechanical one. The process of plowing, planting seed, cultivating growing crops; the process of harvesting, threshing, grinding, hauling, and elevating are all mechanical operations, and it stands to reason that mechanical power must be used in accomplishing such jobs. In fact, mechanical operations are more accurate than those dependent upon manual labor. The corn planter, the grain drill, the manure spreader, the lime sower, the fertilizer distributor—all are far more accurate in their distribution of grain and fertilizer in the fields than is possible by hand labor. Machines have been developed to accomplish almost every farm job, and the only thing lacking, until recently, in farm operation is the lack of mechanical power to operate these various farm machines.

When the gas tractor first came on the market, it was a large, cumbersome, slow-moving piece of mechanism, and rather too large and too expensive to be operated with profit on the small farm. During the early days of tractor development, the possibilities of the tractor in farm work were limited mainly to belt work and plowing. However, with modern design applied, a tractor has been produced to be used in connection with almost every farm machine; therefore its versatility is almost as great as the demands of the modern farm.

A brief discussion of the tractor is not complete without looking into the vast amount of improvement and refinement which has been found necessary in the building of a successful agricultural tractor. To reduce the weight of the machine to the point where a large part of the energy of the engine can be applied directly to the operation of the tractor drawn implements, it was necessary to make the tractor light weight and yet strong enough to stand up under field work. To make the tractor a road proposition, several manufacturers have experimented with changing from the steel wheels to rubber tired wheels and so far the experiments indicate that the tractor may, through the change of wheels, be used on the road with good success.

Undoubtedly within the next few years the operations on almost every modern American farm will be by mechanical power. If the manufacturing concerns or the railroad companies should begin their operations on a unit of one man directing two horse power, as on our farms, our transportation and freight rates would be many times what they are at present, and our manufactured goods would be much higher in price. With the vast population of the cities and suburban districts of the United States, the unit of farm labor, to supply agricultural products to the nation at a reasonable cost, has got to be changed from one man plus two horses.

Missouri Jersey Calf Club

Recently a Missouri Jersey Calf Club was organized in Audrain County, Missouri, in which 25 head of Jersey calves are now being cared for. These calves vary in age from six months to 22 months, each club member stating age of animal he desired. Notes were given to a local bank for the calves which will be sold a year later.

Mold in Silage Due to Dryness

The usual number of complaints are coming in regarding the presence of mold in silage. Mold can grow only when air is present. Air generally gets in as the result of the silage being too dry when put into the silo. If water was added not enough was used. Poor packing may cause the same trouble. Mold around the doors and against the wall is the result of poor construction of the silo which allows air to enter. Nothing can be done now to remedy the conditions. At the next filling time special care should be taken to see that the corn contains enough moisture and that it is well tramped. It is always safest to reject moldy silage, especially for horses and sheep, although for cattle there seems to be little danger.—C. H. ECKLES, Chief of the Division of Dairy Husbandry, University Farm, Minnesota.

Uncle Ab says that you can call him a pagan if you like, but he bows to the twin goddesses of health and happiness.

Sudan Grass and Cowpeas

Two Grazing Crops Which Combine well as a Mid-summer or Dry Weather Pasture

HOARD'S DAIRYMAN:—My experience in the pasturing and grazing of Sudan grass and cowpeas combined for cattle, for beef and milk cows, may interest others who have suffered losses when the common summer pastures fail during periods of drought.

I have tried these new crops out on a small farm for the past three years and find the combination a perfect success. I have run a dairy for ten years on my farm in Kentucky. Every year about July we have the regular summer drought, some seasons much more than others, but always enough to dry up and make a shortage of pasture. Then the cattle that have been in thriving condition show at once that their pasture is gone or is not sufficient to keep them in a thrifty condition. At this time my Sudan and cowpeas field is ready for business with plenty of good green pasture from 5 to 7 feet high and as thick on the ground as you sow and want it.

The way to prepare this pasture is as follows: Break the ground the same as for corn or oats. When the time comes to plant corn, sow Sudan broadcast, 20 pounds to the acre, and three-fourths bushel of cowpeas or soy beans per acre. Sow them at same time but separately so as to get an even distribution. Then double disk the seed in and the work is all done. You sow one acre per head, if large cattle, and three-fourths per acre per head for six or eight hundred pound size. For the best results the pasture should be sown in two separate fields, equally divided, and then change from one to the other every ten days. The first field grazed will sprout new growth at first joint below where the cattle bite it off, also at root, and will gain much of the loss from grazing while the cattle are on No. 2 and the same will be true with No. 2 when the cattle are turned back on No. 1. This change should be made every ten days.

The cowpeas are sown for three reasons: First, it gives a little variety or change; second, it gives more in quantity; and, third, it takes care of the soil proposition.

Sudan grass was brought to this country from Africa only a few years ago. It is a drought resisting grass, will stay green until the frost kills it. Cattle of all kinds like it and will eat in preference to any other grass as long as they can get it. Milk cows will stay fat all summer, drought or no drought, and will be beef fat at close of season. It is quite different with milk cows that go through a drought season without it.

The time has come for the farmer to find new and better methods along many lines of farming so he can produce better, cheaper, and more produce for less money than he has in days gone by; and to produce more and better grazing, for less cost, is one of the first important steps in that direction. Grazing is one-half the value in farming. There is much more that can be said about the value of the new and valuable crop. It makes on good soil about three times as much feed or pasture as a good clover field, so you can see at once the value of the new crop. Sudan grass will make a good hay crop and can be cut twice during the season, making from five to six tons per acre. After using Sudan and cowpeas combined as pasture for my dairy for three years and knowing the value of it I would quit the dairy business if I could not get it.

If farmers and dairymen will provide themselves with this pasture and have it ready to turn their milk cows and beef cattle on at the beginning of the drought season they will not be forced to rush them on the stock yard markets and force a glut of cattle and also a low price on account of not having sufficient pasture at home to graze them through the dry season. Many a good milk cow is sacrificed and sold as a canner because she has lost her flesh and is not able to give a sufficient quantity of milk for the lack of sufficient green feed to carry her through the season. There is nothing that is more discouraging for a cattle man than to have a lot of cattle and nothing to feed them.

Kentucky. I. F. JEWEL.

Edinboro, Pa.

WORLD'S RECORD HOLSTEINS
Two bull calves born November 19, 1920, sired by Carnation Denver Segis, an oustanding son of Matador Segis Walker, sire of three world's record daughters and half-brother to the world's record cow—Segis Pertiertje Prospect.
Fredmar Matador Colombo De Kol, evenly marked, out of Nezi Pontiac Rose Beets, a three-year-old on yearly test, milking over a ton a month and getting better each month. Price—$150.00.
Fredmar Matador Canary Paul, seven-eighths white, out of Francis Burke Homestead, a six-year-old on her first test, but milking over 2,100 lbs. a month, ranked 4th in over 300 Missouri Dairy Cows last month, this month she increased milk nearly 200 lbs. over last month and is getting better every day. Price—$200.00.
Both calves are sturdy, vigorous, healthy and will make splendid sires, growing in value every day on account wonderful records being made by Matador's sons and daughters.

Two Other Good Ones
Sir Fredmar Ormsby Rag Apple, born Oct. 21, 1920, sired by Sir Ormsby Akkrummer Hengerveld, grandson of the only 1,500-lb. cow. Dam, a show heifer of great size and splendid conformation, will be shown at State Fairs and National Show this year. She is on yearly test. This bull is a beauty, fit to show in any company. Price—$250.00.
Fredmar Calamo Hengerveld, son of the famous show bull, Joe Calamo Hengerveld, born Dec. 9, 1920, out of a two-year-old daughter of King Segis Pontiac, the famous bull with hundreds of famous sons and daughters. This heifer was first prize winner at New York and Ohio State Fairs in 1919 and her son will repeat as he is beautifully marked.
Will ship any of the above, carefully crated on receipt of check. Fuller details cheerfully furnished on request.

Many more good ones we cannot mention due to lack of space. Sold subject to a 60-day retest.

March 29 — Dispersion of the Fred Gessert Herd

3 miles north of Plymouth—4 miles south of Elkhart Lake. Every animal in the herd will be sold except 9 yearling heifers which are to be kept for a future herd.
This is a herd of good producers and includes Lady Pinehurst Johanna, a great 2-year-old, fresh at sale time; May Johanna Dale, a splendid young cow, granddaughter of Albina Johanna Fayne; Beauty Korndyke Segis, an excellent individual, granddaughter of Johanna McKinley Segis; and others equally good.

March 30 — Sale of the Roland M. Goelzer Herd

located 2 miles north of Plymouth on the Elkhart Lake road. The entire milking herd—everything above 2 years old—will be sold. At the head of this herd is Neith Witteen De Kol Prilly, a grandson of Admiral Walker Prilly from a 31-lb. cow that produced 1,127 lbs. butter in a year.
The sale includes Lady Mechthilde Dale, a 19-lb. show cow (502 lbs. milk in 7 days); a 20-lb. cow; Jessie Carmeline Johanna Fayne, a 14.98-lb. 2-year-old granddaughter of Albina Johanna Fayne; a 16.4-lb. cow and her 21-lb. daughter; and a 15-lb. 2-year-old granddaughter of Albina Johanna Fayne. Sale commences at 1 o'clock.

March 31 — Hand & Traxler Dispersal — 24 Registered Holsteins, 35 High Grades. (Sale at the Farm, 1¾ Miles South of Plymouth)

It includes a wonderfully good yearling bull—a 34-lb. double grandson of King of the Pontiacs. He's a real show bull. Also 2 granddaughters of King of the Pontiacs, one from a 23-lb. 4-year-old, one from a 25-lb. 4-year-old. Our senior herd sire, King Longfield Pontiac Daisy, will be sold. He is by a son of Pearl Longfield De Kol, 1,215-lb. cow with over 28,000 lbs. milk. This is a breeder's herd.

This is an excellent opportunity to select what you want from 4 of the best Herds in Sheboygan county

BUY DIRECT

Reasons for Buying Holstein Cattle in Waukesha County:

1. You can buy direct from the breeder through the breeders' association, organized by the breeders to promote the breeding of more and better Holstein cattle and to assist in a fair marketing of the same.
2. There are over 50 pure-bred Holstein sires in service in Waukesha County whose dams have records of over 30 lbs. butter in 7 days or 1,000 lbs. butter in a year.
3. There were 1,307 long-distance tests made on Holsteins in Waukesha County during the past year, which is more than the total in the next four leading counties in the state.
4. There are more tuberculin tested cattle in Waukesha than in any other county in the world.
5. The breeders' organization is in a position to put you in touch with "bred-for-production-stock" at reasonable prices.
6. When buying through the Association, you obtain the services of men who devote their entire time to the Holstein industry. It saves you time. You get more for your money.

March 29th and 30th

Two Big Days at Watertown, Wis.

125 Head of Pure-bred Holsteins

A son of King Hengerveld Pietertje Ormsby from a 24-lb. Jr. 2-yr.-old daughter of S. P. O. M. 37th. Consigned by Wuethrich Bros., Doylestown, Wis.

A son of a 24-lb. cow and sired by King Canary Oak De Kol, a 34-lb. sire. Consigned by Fred Albrecht, Watertown, Wis.

One of the real foundation kind. Due about sale time. Consigned by Fred Albrecht, Watertown, Wis.

Why Watertown, Wis., Sales Attract—

Because the Watertown Sales People have always shown the same enthusiastic interest in their patrons after the sales that they manifested prior to the sales.

Because Watertown Sales have been in operation sufficiently long to withstand the rigid test of public scrutiny.

Because Watertown cattle are not gathered indiscriminately; they are accepted only on the approval of competent inspectors.

Because Watertown Sale offerings are GOOD offerings.

We realize furthermore, that each succeeding sale must either decrease or increase the confidence the Holstein going public has in our proposition.

Let us give you an idea of the quality of our offerings!

We have a good 25-lb. three-year-old, a 19-lb. three-year-old, both bred to Hunter Bros. well-known 37-lb. son of Champion Echo Sylvia Pontiac; we have a daughter of a 25-lb. cow due sale time by a son of 37th's only 30-lb. daughter having 1,000-lb. yearly record; we have a 25-lb. cow making 800 lbs. on yearly work—a two-year-old daughter of a 24-lb. cow, a yearling daughter of an 18-lb. two-year-old, these bred to a 33-lb. bull. We also have an 18-lb. two-year-old as well as another good daughter of a 24-lb. cow. We have a daughter of a 25-lb. 4-year-old. We have two daughters of Beauty Pietertje Prince bred to a son of Matador Segis Walker out of a full sister to Segis Pietertje Prospect. Bear in mind that in addition we have some very choice individuals, untested, well along in calf to some of Wisconsin's very best sires. They come from long established herds and clean herds.

Our bull offerings are exceptional !

We have a yearling son of the well-known 31-lb. heifer that sold in the State Sale for over $4,000.00 last spring. This sensational heifer has just completed a 265-day record of 1,010 lbs. butter and 20,170.8 lbs. milk. He is sired by a good son of Sir Pietertje. You'll also find in our catalog a son of a 24-lb. junior two-year-old daughter of 37th, sired by Mr. Erickson's well-known full brother to Pietertje Maid Ormsby. Just the combination many breeders are trying to locate. We have a choice yearling son of a 31-lb. show cow, sired by a 33-lb. son of King of the Sadie Vales. We have a good yearling son of a 29-lb. cow; this fellow is bred strong in the Homestead Jr. strain. We have also listed a good 27-lb. yearling and a 26-lb. yearling. These bulls are the kind you often drive over the country, to no purpose, to locate.

A $1000 Bull For $500

Count Segis Lyons 281218—Our Jr. Sire 2 Yrs. Old

His sire, King Lyons, nine 30-lb. daughters. His dam, Julia Lyons Pontiac, a 24-lb. 3-year-old granddaughter of King of the Pontiacs. His 7 nearest dams average 30.27. His 15 nearest dams average 28.28. He is ⅞ white, gentle and sure, will put you on the Holstein map. Terms to purchaser if desired. Several other high record service bulls $100 to $200. All animals tested in February with triple test.

Henry J. Karpinski, R. 7. Oswego, N. Y.

Holstein Bull

Tuberculin tested and ready for service. Sired by King of the Changelings, a 33-lb. son of King of the Pontiacs. Dam, a daughter of a 33-lb. sire and has an A. R. O. record of 15.57 lbs. butter in 7 days at two years of age, averaging almost 4%. He is well grown and a splendid individual. First check of $175 takes him.

HARRY W. PETZOLD, Owego, Tioga Co., N. Y.

THE MARK OF QUALITY

King Hengerveld Korndyke Eureka

A bull of excellent line breeding. 9 months old, will make an ideal junior herd sire for some breeder. Especially owners of sons of Count or breeders of Ormsby blood.

King was sired by Sir Ormsby Hengerveld Korndyke a son of Pietertje Maid Ormsby 35.56 butter, 535.40 milk in 7 days. His sire was Sir Korndyke Hengerveld De Kol sire of 45 A. R. O. daughters including Miss Korndyke Akkrummer Ormsby 39.53 butter in 7 days.

The Dam Eureka Melissa Segis is by a full brother to Count. She traces back to Old King Segis and King of the Pontiacs on the sire's side. On the dam's side, her grandsire was Paul Beets Walker sire of Spring Brook Klara Beets, Spring Brook Aaggie Walker and Spring Brook De Kol Klara. Eureka herself has a 7-day record of 25.08 and is finishing her year well over 750 pounds.

This young bull is for sale to some breeder who has a herd that he will fit into. Write us and we will send you his complete pedigree and let you be the judge of his worth. Better still, come to the farms at Blooming Prairie and see him.

Blue Earth County Breeders' Sale

March 22—Mankato, Minn.

49 Registered Holsteins

to be Sold in the New Sale Pavilion

This will be one of the best county sales of 1921. The breeders of Blue Earth county are putting in good ones, the kind that will suit you.

They will sell a splendid lot of Ormsby heifers—typy ones—many of them bred to a son of Ormsby Korndyke Lad from a 1000-lb. 2-year-old dam.

Among the good A. R. O. cows and heifers to be sold is a sister to Duchess Skylark Ormsby.

There will be several mighty good bulls—some of serviceable age—from record dams.

The Sale is under the management of the State Association— a guarantee that it will be conducted right.

Liberal terms of payment are offered—time given on approved notes.

Send for your Catalog today.

406 Market Bank Bldg., MINNEAPOLIS, MINN.

A Richly Bred Yearly Record Bull
Offered For Sale

King Piebe Johanna Ormsby
Born September 25, 1920

He is the kind of individual we make no apologies for—Straight as a line, square-butted, great quality and loads of style.

HIS DAM

PIEBE JOHANNA HOMESTEAD—A beautiful cow now on yearly test as a four-year-old. She began her test with a seven-day record of 22.51 lbs. butter. Her dam is De Kol Piebe Burke, 1,086 lbs. butter and 27,611 lbs. milk in a year as a ten-year-old. Her sire is from a 29-lb. daughter of Homestead Junior De Kol and Johanna Fayne Rue, a 31-lb. daughter of Sir Johanna Fayne.

HIS SIRE

SIR BESS ORMSBY ALICE—A line-bred Sir Pietertje Ormsby Mercedes sire. His dam is Alice Tritomia Ormsby, a 34-lb. 1,033-lb. daughter of Sir Pietertje Ormsby Mercedes 21st. His sire is Sir Korndyke Bess, son of Bess Pietertje Ormsby Mercedes, 1,235-lb. daughter of Sir Pietertje Ormsby Mercedes and Spring Brook Bess Burke.

The two grandams of this young sire are both 1,000-lb. cows. His own dam shows every indication of some day reaching the same mark. He is priced within easy reach of the small breeder.

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

Sir Walker Segis Homestead

The best show bull and son of the great bull, PIEBE LAURA OLLIE HOMESTEAD, out of a "COUNT" daughter, BEAUTY BEETS WALKER SEGIS, world's greatest heifer, with two yearly records over 25,000 lbs. milk and 1,000 lbs. butter in heifer form, and a seven-day record of 35.03 lbs. butter from 730 lbs. milk.

We offer several choice bulls, one month to a year old, out of high yearly record and A. R. O. cows, at very reasonable present day prices. Pedigrees and photos will be sent.

A. J. LASHBROOK, Northfield, Minnesota

Sons of "COUNT"—
—"The Marvel of All Sires"

Whose daughters have broken more World's Records than the daughters of any other sire of the breed in both long and short time work. He has eight 1,000-lb. daughters.

Sons of "PIEBE" — "The Present Day Sensation"
The only bull in the world with five 20,000-lb. two-year-old daughters.
Sons of "COUNT" from daughters of "PIEBE"
Sons of "PIEBE" from daughters of "COUNT"

We have the finest line of young bulls we have ever raised at ARDEN FARMS, priced in accordance with present financial conditions. LIBERAL TERMS GIVEN IF DESIRED. Write me for particulars.

J. M. HACKNEY
602 Merchants Bank Building, - - - St. Paul, Minnesota

Bull Calves of Ormsby Breeding

from A. R. O. dams for sale, 2 to 8 months old. Prices $200 to $1,000. We can also offer several good, typy cows bred to a good Ormsby bull. Write or come and see us.

MINERAL SPRINGS STOCK FARM, - - SAVAGE, MINNESOTA
Stuart—McIntyre—Hansen, Owners.
Address correspondence to Axel Hansen, formerly with John B. Irwin.

Serviceable Sons of Dutchland Aaggie Tidy Prince

I have three of these youngsters for sale, all ready for service and from A. R. O. granddaughters of S. P. O. M. Their sire is from a sister to Tidy Abbekerk Prince and already has a good list of tested daughters, including one above 36 lbs.
Write today for complete information.
E. J. BROSIOUS, - - Stillwater, Minn.

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams.
For pedigrees and prices, write
O. J. GROVER, - GLYNDON, MINN.

Grandsons of Duchess Skylark Ormsby and of S. P. O. M. 38th.

for sale. These youngsters are from A. R. O. dams that are now making good yearly records. Write today for further information.
POPLAR HOLLOW STOCK FARM,
Bertram D. Scott, Prop., Richfield Station
Minneapolis, Minn.

Bull Calf

advertised last week is sold. Here is another good one ready for light service. Sired by a 30-lb. bull. Dam a 14-lb. 2-year-old who will be tested again next spring. Priced so reasonable that you can't afford to be without him. $150.00 for immediate sale.

V. R. Holmes, Anoka, Minn.

Get A Calf

We have a grand bunch of youngsters on hand. Come and pick out a calf while you have a big choice. Grow him to suit you. Saves you money and we are selling them as cheaply as we can. Show calves that are backed by generations of official testing and careful breeding. Sons of DUTCHLAND CREAMELLE COLANTHA LAD No. 165049. His yearly daughters all average over 834 lbs. of butter at 26 months of age.
GRAHAMHOLM FARMS,
H. R. Searles, Mgr., Rochester, Minn.

Sir Korndyke Ormsby De Kol 15th—21 Months Old

His sire is a son of Sir Korndyke Hengerveld De Kol; 51 A. R. O. daughters, one of whom has a 7-day record of 39.56 lbs. and several above 1000 lbs.
His dam has a record of 23.778 lbs. and now on yearly test.
Geo. H. Elwell, - Minneapolis, Minn.

HOLSTEINS—Females

We offer some very choice females, all ages, priced very reasonable. Mostly bred to our 34-lb. bull, Piebe Count Com. One or a carload.
BLACK AND WHITE STOCK FARM,
Route 3, Melrose, Minnesota

Are You Fooling

around with a bull that is a he-cow and nothing more? Are you going to keep on using him? We have a bull circular that we would be glad to send you. A bull circular.

Flecks Farm, Faribault, Minn.

COME TO BISCAY

for your next purchase of pure-bred or grade Holstein cattle, mature or young stock. Large selection, also a few select male calves to offer. Located near station
BISCAY SALES CO., BISCAY, MINN.

Lake Shore Farm

Offers May 22nd, 1920, bull calf, 795 lbs. butter over 20,000 lbs. milk is his dam's yearly record. King Segis breeding, light color. Price for January $250.
E. J. OPPLIGER, Box 20, Forest Lake, Minn.

Holstein Bulls
At Farmers' Prices

We are not in the game to get rich but to help promote the breed by offering pure-bred bulls at the lowest prices, enough to cover raising. Write for prices and descriptive list. The Ormsby kind.

RAMSEY COUNTY HOME,
J. E. McMahon, Supt., North St. Paul, Minn.

Mankato Holstein Farms

Offer a Son of
King Colantha Ormsby Bess

A Sir Pietertje—Bess Burke combination. Nine dams average over 1,000 lbs. Dam is by a brother to Pietertje Maid Ormsby. 894 lbs. butter and 21,833 lbs. milk last year. Running at a world's record gait for the year. Over 400 lbs. butter and 10,000 lbs. milk first four months. Several bulls at prices warranting their use in grade herds.

Write or better still come and see them
(Herd under State and Federal Supervision)
Marlow & Randall, Mankato, Minn.

RICHLY BRED
HOLSTEIN BULL CALVES

out of A. R. dams and sired by our two richly bred herd sires — **King Piebe Ormsby Mercedes**, a 35-lb. son of Sir Korndyke Bess and every dam in pedigree over 22 lbs. and **King Pietertje Mercedes Ormsby**, a son of Sir Pietertje Ormsby Mercedes and out of a 19-lb. senior two-year-old dam.
Herd tuberculin tested. Write for information or visit herd.
P. FROST SPAULDING FARM CO.
C. L. Spaulding, Mgr., Warren, Minn.

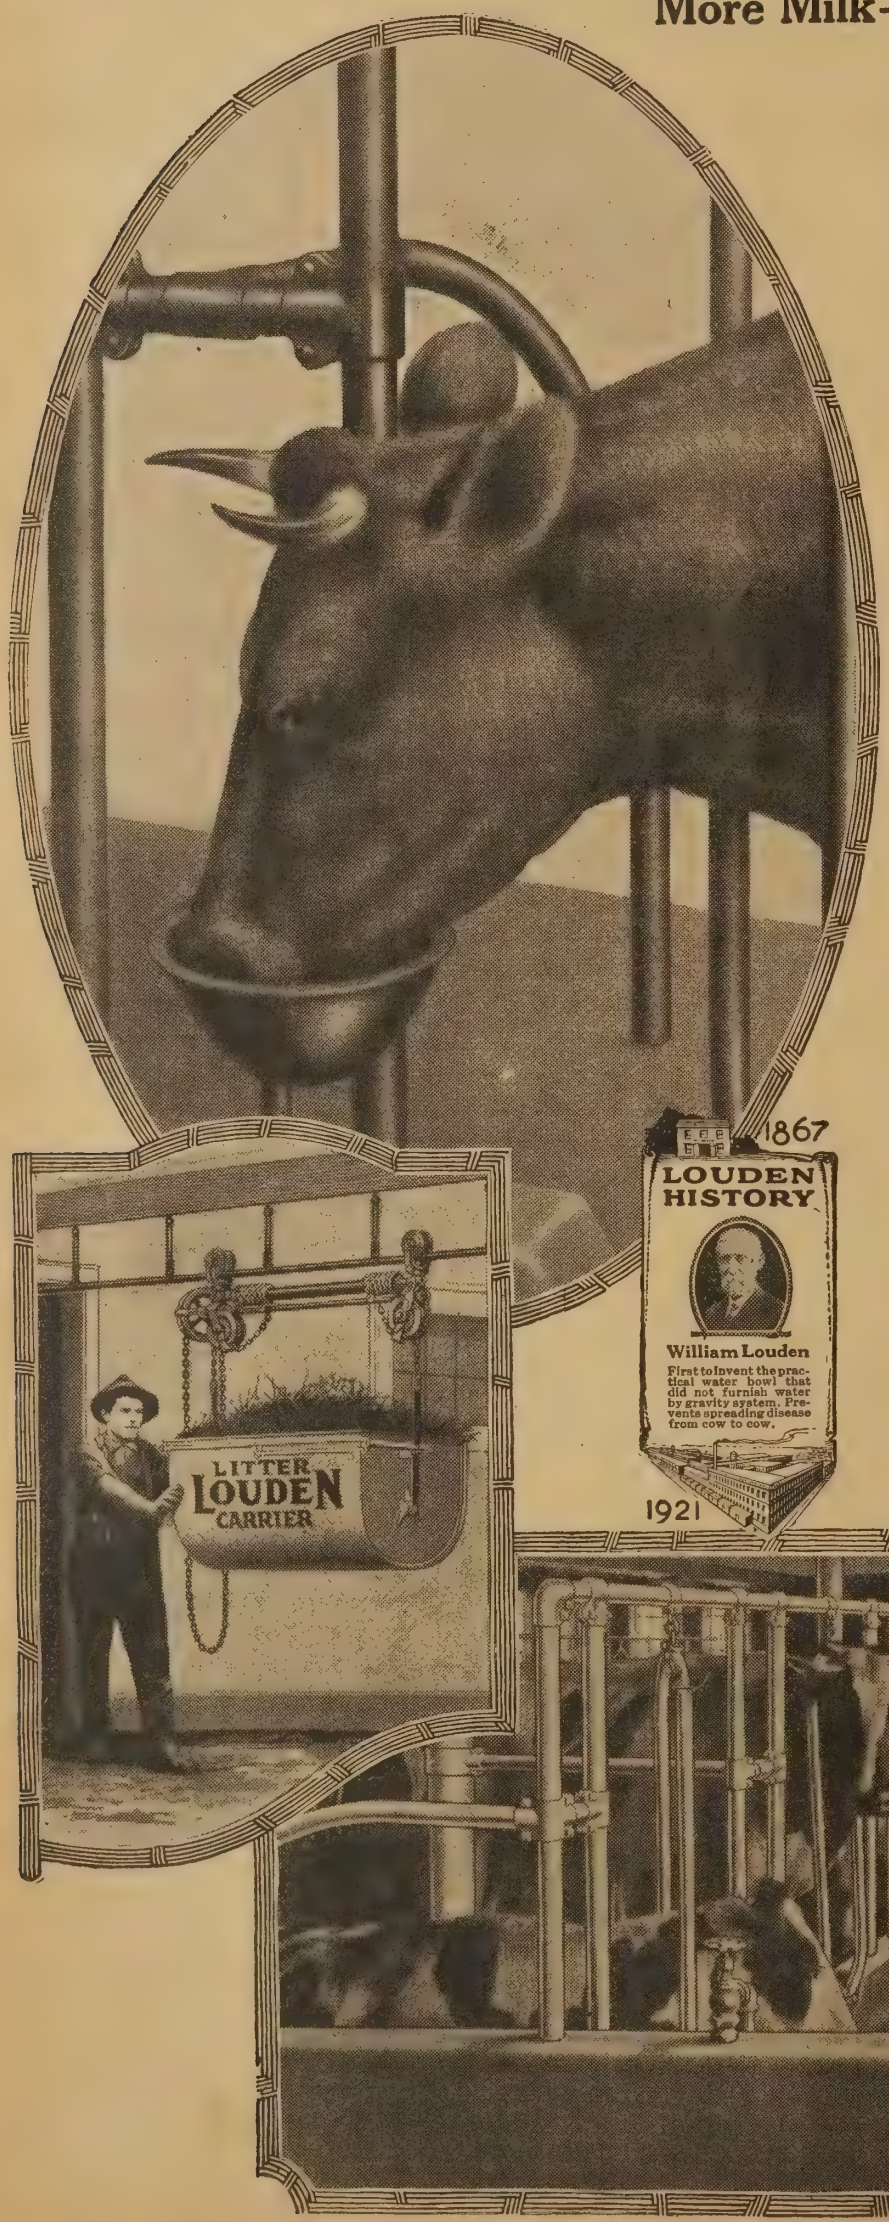
Richly Bred Ormsby Bulls
From Yearly Record Dams—Age 1 to 14 Mos.

Six three-year-old heifers in my herd (under ordinary farm conditions) have just finished yearly records averaging 722 lbs. butter from 16,639 lbs. milk. To make room for calves now coming on, am offering at bargain prices three grand individual sons of above cows ready for service. Act quick. Herd under Federal Supervision.
F. A. STILLINGS, Frazee, Minn.

"DUKE"

The only place you can buy sons of serviceable age sired by DUKE PIETERTJE KORNDYKE ORMSBY

The bull selling at the last Minnesota state sale for $33,000.00 is from the herd where he stood for three years prior to the sale. "Duke's" dam now has three records above 1,000 pounds, the last one was 1,190 pounds.
Now is the opportune time to buy one of these bulls as their sisters will be given every opportunity. Get a son now and be in line. Clean bulls from a clean herd. Prices reasonable. Write
EDW. H. ULRICH, Biscay, Minn.



HOLSTEIN BULL—FOR SALE

Ready for service and two-thirds white. Sired by Sir Glen Johanna, whose 7 nearest dams average 25.38 lbs. butter in 7 days. Also has 22-lb. junior 2-year-old full sister. Dam is an untested daughter of Sir Linda Johanna Champion, with good prospect for fine record. Price $100.00.
Adams Bros., Owatonna, Minn.

LOUDEN

LABOR SAVING BARN EQUIPMENT

More Milk—A Cleaner Barn With Half the Work

Peter Nelson of Amery, Wisconsin, was considerably put out when his pump broke last winter. You couldn't blame him—he had just installed Louden Water Bowls a few weeks before and was thoroughly convinced that giving the cows all the water they wanted, when they wanted it, and at the right temperature, was equally as important as giving them all the feed they needed. But you should have seen him when he figured up his milk sheet the next day after the accident occurred. A dollar's worth less of milk on only 12 cows. For two solid weeks while Mr. Nelson had to herd his cows out twice a day to shiver through a drink of icy tank water, he was losing a dollar a day. His milk sheet proved it, for with the pump fixed and the cows again drinking out of the Louden Water Bowls, up went the production automatically.

Frank W. Morrison, Worcester, Mass., reported 40% more milk from his herd right in the dead of winter after putting in Louden Bowls. Hundreds of dairymen show from 2 to 5 lbs. increase per cow per day. And it's reasonable too, for milk is seven-eighths water. While it is true that every cow produces milk from two things—feed and water—you will agree that most cows get all the feed they need even though feed costs money, but did you ever stop to think how few get all the water they want—and it costs practically nothing.

In addition to the increase in milk yield, Louden Bowls do away with that cold, disagreeable chore of chopping open the ice in the tank and the time and work of turning the herd out to water twice a day.

As long as you don't have Louden Water Bowls you are losing money. Your herd doesn't have the chance to show you how great a profit payer it can be. With a steady supply of water at the right temperature your cows will give from 25 to 40% more milk. It counts big in your milk check. Don't go through another winter without Louden Water Bowls. Write us the number of cows you have. You will be surprised how little it will cost to equip your barn with these money makers.

How About a Manure Carrier

The Louden Carrier takes out the equal of five wheelbarrow loads of manure each trip—takes it clean without dripping or scattering—takes it away from the entrance and dumps it. Operates so smoothly that a 12-year-old boy finds the job a pleasure instead of the usual drudgery. Does away with slopping around the barnyard in slush ankle-deep during bad weather. The Louden Carrier is the biggest labor saver on the farm—works for you every day in the year for years to come.

Get These Books—No Cost, No Obligation

The Big Louden Catalog tells all about Louden Labor Saving Barn Equipment, including Water Bowls, Manure and Feed Carriers, Stalls and Stanchions, Animal Pens, Hay Tools, Cupolas, Ventilators, Barn and Garage Door Hangers—"Everything for the Barn." It's yours for the asking.

Going to build or remodel a barn—we can be of great service to you. If you will give us some idea of what sort of barn you have in mind, number and kind of stock you want to house, we will gladly work out and send you without charge, suggestive plans to best meet your particular needs. Also the Louden Barn Plan Book showing many styles and sizes of barns with detailed information on every phase of barn building. It costs you nothing.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Fort Atkinson, Wisconsin Volume LXI, No. 10 March 25, 1921

How to Get This Great Book—FREE

Tell a few of your neighbors we are now offering Hoard's Dairyman **the rest of this year and all of next year for $1.25.** Think of it. Almost a two years' subscription at just a little bit more than the regular price for one year.

Get five of them to subscribe; send in the order—and the book is yours

You Can Get This Book Without Spending A Penny

Feeds and Feeding

Henry and Morrison

Wherever the subject of feeds for and the feeding of domestic animals is discussed, you will find "Henrys" quoted as the last word. It is without question the most thorough and scientific collection of facts on feeds ever brought together. This 701-page book—the seventeenth edition—represents a lifetime of work and research on the part of W. A. Henry, formerly Dean of Agriculture at Wisconsin University. It contains, in boiled down form, all that men have ever learned on the subject. This vast store of knowledge is so carefully compiled and so well indexed that any man who can read can follow and understand it. We would like to put a copy of this book into the library of every HOARD'S DAIRYMAN reader. Price $3.85.

Here's the Offer:

WE WILL SEND a copy of this 701-page book, prepaid, to any reader who will send us just FIVE of the "rest of this year and all of next year" subscriptions at $1.25 each.

USE THIS COUPON—TEAR OFF ALONG THIS LINE.

HOARD'S DAIRYMAN,
Fort Atkinson, Wisconsin.

As per your offer I enclose five subscriptions and remittance of $6.25. Send HOARD'S DAIRYMAN for the rest of this year and all of next year to the names below, and send me the book "Feeds and Feeding".

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXI — FORT ATKINSON, WIS., MARCH 25, 1921 — Number 10

Dairying in England

A. C. McCANDLISH, IOWA

THE proverbial nourishment of the English is roast beef and Yorkshire pudding. Without a doubt their consumption of beef is miraculous, but they do give some consideration to dairying. The average Englishman is not a good dairyman, however, and we find that in a good many of the districts, which produce large quantities of milk, the Scot is not unknown. There are a few localities, however, where the Englishman has been allowed to remain undisturbed. The dairying of England is not by any means a business of small proportions, but with the material advantages which that country possesses, in the way of temperate climate and luxuriant pastures, milk production should be emphasized to a greater extent than it is at present.

Dairy Cattle

England has evolved more breeds of beef cattle, sheep, hogs, and horses than any other country in the world and yet she has not developed a single distinctive breed of dairy cattle of her own. Though Scotland to the north and the Channel Islands to the south have produced dairy breeds of note, yet England, the most prosperous division of the United Kingdom, lags behind her neighbors. The reason is evident—prosperity. English farming has generally been, comparatively speaking, prosperous, and when bad times did occur there were always enough Welshmen and Scotchmen to step in and succeed where the Englishmen had failed. The peoples who had prospered easily have never developed dairy breeds.

England is recognized as the home of the Shorthorn and it is by far the most common breed, yet few would have suspected the extent to which it does preponderate had it not been for data accumulated by the British Ministry of Agriculture in 1915. These show that of the 6,904,774 cattle in England and Wales in that year, 4,413,040 were Shorthorns, and only 440,000 were Ayrshires and 101,233 were of the Channel Island breeds.

The real breeds of dairy cattle are not a large part of the cattle population of England. The Channel Island breeds only make a small proportion of the total and the Holsteins, or, as they are known there, the British Friesians, though increasing rapidly now, were very small in numbers in 1915. A noticeable fact, however, is the increase of Ayrshires in England, and they are now far more numerous than all the other true dairy breeds combined. The great preponderance of the Shorthorn, which includes the Irish cattle which are simply grade Shorthorns imported from Ireland, deserves special notice, as they constitute about two-thirds of the total cattle of England. They produce a very large part of the milk supply of England, unfortunately, but that problem needs greater consideration than can be given in a hurried review of general conditions in England.

The Englishman has not in the past given the attention to his milking herds that his neighbors have and consequently the average production per cow is not as high as it is in Scotland or in some of the Continental European countries such as Holland and Denmark. This problem is now receiving attention and the cow testing associations though still in their infancy will do much to improve this if they are properly pushed by the Ministry of Agriculture which has them under its control.

There has been much talk about the depletion of breeding herds during the period of the war and, though much of this is true regarding Continental Europe, it does not apply to England. The Englishmen have been shrewd enough to maintain their breeding herds of both beef and dairy cattle even though they suffered—and they did suffer—from a meat shortage for considerable periods.

Labor

Labor is one of the important considerations on the dairy farm and the shortage of it was felt in England for a considerable time even after peace was signed. It was alleviated to a considerable degree by the fact that large numbers of women work on the land and many more turned to this during the war. Most of the farms made cheese, the great proportion of the cheese and farm butter being made by women.

The man shortage was very apparent, though less so than in some other industries. The building trades suffered severely and are not recovered yet. During last summer a government representative stated that while there were 73,000 brick layers in 1914 there were only 53,000 in 1920, or a shortage of 20,000 men with 6 years of arrears in building to make up. This is a serious condition and housing facilities are totally inadequate at present, though landlord profiteering was prevented by act of parliament.

Labor troubles, as all know, have been frequent in England and they have affected agricultural conditions more there than in any other part of the British Isles. This is mainly due to the fact that no agricultural district of England is far from a large industrial center and the unrest which generally starts in such localities spreads to the farming communities. Farm laborers' strikes did occur and, although we tried to get into one which was widely heralded in a Liverpool paper on the day we landed, we found it too elusive.

The Feed Supply

The dairy herds of Central England have the best pastures in the world. There is nothing to equal the meadows of Cheshire and many other districts are almost equally well favored, though the South of England quite frequently suffers from drought. In winter roots supply the succulent feed, mangels being more popular than turnips and swedes as they are easier to grow in many sections and give larger yields. In many districts some use is made of the pasture throughout the winter and some of the herds are never housed except during stormy weather.

Silage has been known in England for centuries and a considerable amount of it is used at present though the typical American silo is practically unknown. One of the favorite methods of making silage is to cut the hay crops and stack them green. The outside of the stack spoils but the material in the center is excellent feed. Corn is now being grown to a limited extent though mainly for soiling, and, though it does not mature, remarkable heavy yields of green forage are obtained. Soiling is a fairly common practice and such crops as green barley, oats, and vetch, and cabbage are generally used.

The dry roughages used are generally oat straw, clover or mixed hay, and a little alfalfa, or, as it is known there, lucerne. Another legume, sainfoin, is also in use.

Practically the only home grown concentrates used are oats and beans, both of which are ground for feeding. The bean meal is an exceptionally good protein concentrate. Barley is also used to a small extent. The other concentrates are all imported and amongst them are corn from the United States and Argentine, bran from the United States and from imported wheat which is locally milled, soy beans from the Orient, beans from Egypt, and cottonseed from the United States, Egypt, and India. The cottonseed is generally used in cake form and there are two varieties—the decorticated and the undecorticated. These are made from the hulled and unhulled cottonseed respectively.

The Englishman is a liberal feeder, in fact frequently too liberal to get the most economical milk production. During war times their allowances of feed were restricted owing to the difficulties of importation and even during last summer their feeding was not as liberal as formerly, owing to the high prices prevailing for feeds. Such conditions are rectifying themselves.

Dairy Products

The largest part of the English milk supply goes as market milk owing to the density of the population, and practically every train has one or more "milk vans". Considering the size of the country some of the milk is shipped long distances. For example, some of the London supply is drawn from the midlands and a considerable amount is shipped from the Southwest of Scotland

(Continued on page 433)

ENGLISH MILKING SHORTHORNS

Grow More Clover Seed

CLARENCE M. BAKER, OHIO

TWENTY years ago when almost every farmer grew his own supply of seed—the seed coming from the aftermath after the first crop of clover was taken off for hay. In those days hulling clover seed had a season all its own. In fact the local threshermen were busy with custom work in clover seed hulling soon after the bulk of the grain crop was threshed.

The yields of clover seed formerly were as high as four bushels per acre. In those days farmers concerned themselves little about the amount of seed sown per acre for they always had a home-grown supply.

The situation at this time, however, is typical of a declining agriculture in which possibly the most prominent legume is slowly losing out, the evidence first showing in the failure of the red clover to produce a seed crop; secondly, in a diminished acreage and yield of a legume. At the present time, according to crop statistics, Ohio grows but one acre where she grows nine other acres of corn, wheat, oats, timothy, and potatoes. There is no doubt that the proportion of clover should be closer to a third than a ninth, perhaps a number of natural agencies have made this reduction. Farmers would gladly grow clover if they could do it easily.

Practically all of western Ohio is underlaid with limestone, while the eastern half of the state has but very few deposits. Naturally farmers of western Ohio have been able to "clover-farm" more extensively. However, during the past decade there has been a falling off of the clover acreage in the western half of the state.

Red Clover Difficult to Grow

It is the opinion of most farmers that red clover is more difficult to grow than any other of our common farm crops. It is also their opinion that red clover can not be grown successfully or used to advantage on poor soils. At the Ohio Experiment Station where experiments under field conditions are carried out, the yield of clover has been maintained at 3½ tons per acre for 25 years. The land received 10 tons of manure and 320 pounds of acid phosphate in a 4-year rotation of corn, oats, wheat, and clover. Growing clover under these conditions has not been difficult. The land in these experiments has also been limed at the rate of 2 tons of ground limestone per acre in each rotation.

SEEDING CLOVER ON WHEAT WITH A DISC DRILL AT THE OHIO EXPERIMENT STATION

CLOVER PLANTS AFFECTED WITH ROOT ROT DISEASE

Professor Firman E. Bear, of the Ohio State University, points out that red clover will not grow on worn-out soils and the soils must be supplied with plenty of available plant food in just the same way as for large yields of corn, oats, and wheat. The use of acid phosphate on wheat is especially beneficial for the clover crop following.

In all of the orchard fertilizer experiments conducted in southern Ohio, a liberal use of acid phosphate has brought about a good growth of the clovers even though no seed was applied to these hilly orchard soils. The aim in this case was to stimulate the growth of grasses for mulching hay. However, where acid phosphate is used the clovers have been found to quickly crowd out the poverty grasses. Where acid phosphate is used regularly in connection with lime, the growing of clover becomes easier and it is altogether probable that the clover seed production is influenced directly by the phosphorus content of the soil.

Manner of Seeding

The manner of seeding may have some influence upon the successful growing of clover in Ohio. The mortality of young clover plants is very high so that any means that aids the growth of young plants will be effective in securing a good stand of clover.

It is a common practice to sow red clover broadcast allowing the seed to be covered by freezing and thawing weather. Others when following oats with red clover sow the clover when the oats are seeded.

The use of a seeding drill has an advantage in covering all the seed so that very little seed is killed after germinating. It is necessary to delay grass seeding in the wheat until the

(Continued on page 432)

"Give and It Shall be Given Unto You"

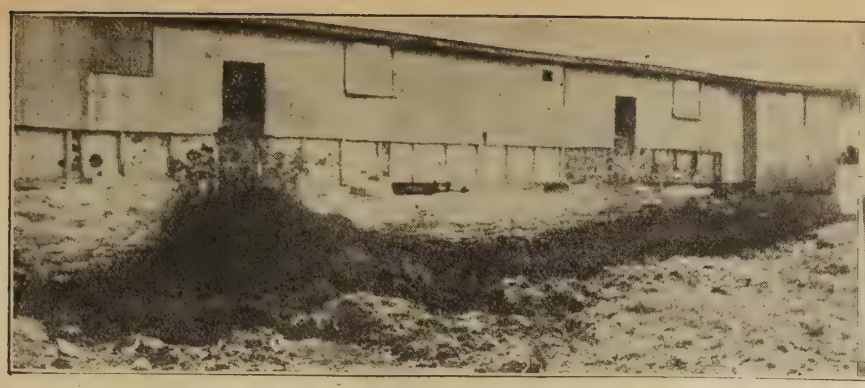
E. G. THIEM, ILLINOIS

"GIVE and it shall be given unto you; good measure, pressed down, and shaken together, and running over shall men give into your bosom, for with the same measure that ye mete, withal it shall be measured to you again."

The message carried in the above quotation from the Scriptures is no less true now than it was in the time of Christ. It works equally as well in the care and management of a dairy herd as it does in man's relationship to his fellow men, and it further proves the point through the story which follows that one's returns from any work, project, or enterprise are commensurate with the amount of energy, enthusiasm, time, and good judgment invested.

H. E. Downing of Illinois, whom this story concerns, was born and raised in the dairy business, and therefore by right of birth and early training grew in wisdom and knowledge in the way to handle cows for best results. He tells this story about his early life: "I was born and raised on a little farm just out of Princeton, Illinois, where my father, as early as I can remember, kept a herd of Jerseys which supplied the small town of Princeton in those early days with the richest of milk and cream. Since I was old enough to hold a pail between my legs, I have milked cows. Instead of growing to dislike the dairy business, as many do, my love for the good old dairy cow increased as I learned more about her likes, dislikes, and possibilities. When I grew older, I was given charge of delivering the milk about town—a job which taught me much about one of the important phases of the dairy business—but which never appealed to me so much as working about the barns and feeding the animals that kept us in business."

Several years after Mr. Downing was married, he moved to Iowa on a farm about two miles away from the state college. "That's where I got my first Holstein cow," Downing often has told me, "and this is how it happened. After moving out to Iowa, and finding that the college offered a good market for milk, I determined to buy a bunch of cows and get back into the dairy business. One day a neighbor and myself started a general conversation about cows. He told me about an old black cow at home that he wanted to sell because she gave so much milk when she freshened that he got tired of milking her, and moreover she persisted in milking heavily right through the hot summer when he didn't have the time or the inclination to bother with such cows. I went around to see that cow and succeeded in buying her for $80, a good price in those days for a grade cow. This cow was Blackie, the first Holstein cow I ever owned. Blackie was a medium sized cow, with lots of length, an unusually great spring of rib, a straight topline, a neat, cleancut head, mild yet alert, watchful eyes, long, slim neck, and an udder that a good judge stops to look at a long time to admire its great capacity, squareness, and high quality, with the teats coming out perpendicular from each corner of the base of the bag."



"I always believed before I got Blackie," said Downing, "that Jerseys were the only kind of cows worth having, and I will always have much respect for that wonderful little breed, but after I had milked Blackie a few times I determined to get a few more of her kind, if possible. By carefully looking around, I picked out enough black and white cows to make a small herd. My first bull I bought for $75, a young white animal sired by Kopsteak's old show bull and out of an 18-lb. two-year-old heifer, her first calf. This young bull I used for my first cross. He proved to be a good one."

Three years ago the call to come back to Illinois, his native state, became so great that Mr. Downing moved back to Whiteside County, bringing with him two of the older cows from his herd in Iowa including Blackie, several of the heifers out of the first cross from the young white bull, and also a young bull from the Iowa State College Herd, and known as Ames Alcartra Pietertje Pontiac, out of a 26-lb. cow in the college herd. The white Iowa bull was left in his native state due to his tendency to become vicious and dangerous. During the spring and summer of 1918, Mr. Downing gradually added the best high grade cows he could find in the new dairy community in which he had settled. By the fall of the same year, the new herd containing Blackie, who was producing better than ever; Swiftie, the other mature cow brought from Iowa; and two heifers, Spec and Snowflake, the former out of Blackie and the latter out of Swiftie, and both by the white bull left in Iowa, had been assembled. During December, 1918, the Palmyra

(Continued on page 420)

H. E. Downing and "Daisy", a grade Holstein whose Cow Testing Association record for 1920 was 16,711 lbs. milk, 565.03 lbs. fat.

NO GREATER WASTE OF VALUABLE PLANT-FOOD COULD BE MADE THAN TO THROW IT THROUGH PORT HOLES LIKE THIS WHERE WATER FROM THE EAVES WASHES IT TO THE SEA

WHERE BARNYARD MANURE IS ALLOWED TO ACCUMULATE IN CARELESS HEAPS, IT IS IMPOSSIBLE TO GATHER AND USE MORE THAN TWO-THIRDS OF THE BULK

DOUBLE RETURNS FROM FARM MANURE

Reducing, Handling and Using Where Most Needed Brings Results

C. A. LeCLAIR, WISCONSIN

IF there is any one thing which farmers throughout the length and breadth of the country are agreed upon, it is that, under any system of farming, manuring of land pays. Men who are working land just cleared from the virgin forest manure their fields as systematically today as do those who cultivate soil which has produced crops for several generations. If farmers in any community caught one of their neighbors moving his farm buildings to get away from the manure piles which had accumulated in the barnyard, or saw him hauling the fertilizer to the river in order to dispose of it, they would take steps to see that the man was placed in an asylum for the feeble minded. Yet men with supposedly sound judgments have done these things within the memory of the writer. All of which goes to prove that times do change our ideas and ways of doing things.

Now, in spite of the fact that every farmer in the country hauls what animal manures are made on the farm to his fields, the best agricultural authorities keep saying that there are billions of dollars worth of home grown fertilizer lost on the farms of the United States each year through improper handling of manures and crop residues and these experts have figures to prove the extent of this fertility loss. Are the experts right, or is what they say just plain "bunk"? It is my firm belief that until more farmers earnestly concern themselves in more than simply dumping farm manures on their land, they will fail to enjoy double the returns from the use of this material, which it is in their power to obtain.

WHEN THE SNOW IS TOO DEEP FOR THE OPERATION OF A SPREADER, MANURE CAN STILL BE DISTRIBUTED IN THIS FASHION

Prices of farm products have increased considerably and the fertility of the land from which they came has in general decreased. Thus an efficient use of farm manures is more important than ever before in the history of the nation. The more farm animals one has, the greater the gain to be derived from a proper use of the fertilizing by-products of the farm. It is true that manure is put to better use today than has ever been the case heretofore and yet it can be made to yield far greater returns.

No better index as to the value of farm manure could be offered than the results obtained at the Kansas Agricultural Experiment Station where but very light dressings were made. In tests conducted in the Sunflower State, it was found that two and one-half tons of farm manure, applied to land growing wheat continuously, gave 7.2 bushels more wheat than where no fertilizer was applied. The same amount of manure applied to alfalfa increased the crop to the extent of 2,384 lbs. of hay to the acre. Even on the rich prairie lands of Iowa, farm manures give handsome returns. If you want to figure out the value of a ton of manure when applied to the best land that lies outdoors, just add up the value of the following crop increases which were attained at the Iowa Agricultural Experiment Station and divide by eight. There on land where eight tons to the acre of manure were applied once in four years, an increase of 11.4 bushels of corn, 17.1 bushels of oats, and .7 of a ton of hay were harvested over what similar land unfertilized produced.

A Perishable By-product

Farm manure is a fertilizer of an extremely perishable nature when accumulated in quantities of considerable size. On the other hand, if the same material is collected under approved conditions it will yield its full fertilizing value. When manure from farm animals is piled in a heap which is exposed to the weather for six months, it loses one-half of its bulk and more than a third of the plant food which it contains. It would not therefore take a mathematician long to figure the number of months of exposure that would be required to make the fertilizer valueless. In speaking of this matter, Professor F. L. Duley of the Missouri Agricultural College says:

"Not many men deliberately neglect farm manures but the better methods of handling it have not been adopted by the majority of farmers of Missouri. At a conservative estimate they lose at least $20,000,000 a year, an amount equal to sixty cents for each acre of cultivated land in the state, because of their failure to use the best known methods of handling and utilizing the fertility in manure."

Missouri farmers are representative of the nation and it is safe to say that the same conditions prevail in other states. Under any system of farming, it is always necessary to let some of the farm manure accumulate in the barnyard. For this reason farmers can well afford to take every precaution in stacking the material so that the pile has square sides, a flat top, and is well compacted. If the fertilizer is stored in this manner, decay is postponed but not entirely prevented. But the solid portion of manure is only the small half of the whole fertilizing value of the animal excrement. Careful tests at the Ohio Agricultural Experiment Station to determine the plant food losses which occur in the handling of the product reveal the astonishing truth that when the droppings fall on anything but a water tight floor, it is impossible to collect more than three-fourths of it. They gathered 12 tons of liquid manure from 25 well bedded cows in 125 days. Likewise when feeding steers, it was found that fully $4.50 worth of plant food per hundred weight of live stock escaped in the drains. It is because of this that we find such up to date farmers as the late Charles Wilder, Massachusetts, Conrad Kruse, Wisconsin, Metcalf Bros., Wisconsin, strong adherents to the European Jauche system of collecting and distributing liquid manure. These men not only make the best use of the solid manure produced on their farms but they have cisterns to collect the liquid fertilizer not absorbed by the bedding they employ. From the cisterns the manure is pumped into a tank distributor and conveyed to the fields. According to Mr. Kruse, the Jauche system has a place on the farm even where animal manures are daily carted to the fields. He finds that the liquid manure is particularly adapted to the top dressing of grass land.

TO SAVE FEED AND FERTILITY, NOTHING BEATS A CEMENT FEEDING FLOOR

The Easiest Way the Best

Appreciating that the safest way to avoid loss of plant food in manure is to get it on the land as soon as possible after it is made, some farmers place their spreader so that the fertilizer can be dumped into it and hauled to the fields as soon as a load accumulates. When this plan is followed a maximum amount of plant food contained in the product is made available to crops. Strange to say the same manure which practically evaporates when carelessly stored dissolves much slower when spread in a thin layer over the land. The sun's heat does not spoil it, neither is it spoiled by freezing when distributed during the winter, opinions to the contrary notwithstanding. In fact, barnyard manure becomes available to plants so gradually that cases are on record where benefits to crops have been measured as many as forty years after the fertilizer was spread. This is why market gardeners compost manure before using it and general farmers supplement manure with immediately available commercial fertilizers to get best results.

It is a big job and takes considerable time to haul manure onto the land. To get down to concrete figures, it costs no less than a dollar a ton to load and spread the stuff. This dollar can be added to the profits from the material if farmers permit live stock

(Continued on page 424)

PASTURING SHEEP AND OTHER LIVE STOCK ON THE BORDERS OF THE FARM IS PROBABLY THE BEST WAY OF MANURING SUCH LAND

At the Price of Two Eggs

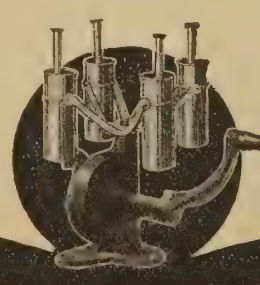
At the cost of the price of two eggs a big Jell-O dessert can be served—and it will serve from five to twelve persons, according to the manner in which it is prepared.

If plain, it will serve five or six persons; if whipped, Bavarian cream style, ten or twelve may be served.

There are so many possibilities—so great a variety of delightful dishes made without cooking or fussing—that every farmer's wife is urged to send her name and address in order that she may receive (free) a copy of the Jell-O Book, which has everything on the subject that any woman could wish. Among other things it tells how whipped Jell-O takes the place of eggs and cream in desserts.

Jell-O is put up in six pure fruit flavors: Strawberry, Raspberry, Lemon, Orange, Cherry, Chocolate, and sold in all general stores and groceries at **25** cents for **2** packages.

THE GENESEE PURE FOOD COMPANY
Le Roy, N. Y., and Bridgeburg, Ont.



$6.95 BUYS A CREPACO Babcock MILK TESTER

Don't Keep Boarder Cows!

Appearances are deceiving. The cow you think is best may be unprofitable. The man who **knows** is the man who succeeds. The Crepaco Babcock Tester shown below will point out the unprofitable cow. It will enable you to buy cows with open eyes. It will enable you to secure adequate remuneration for your milk and cream.

Free Glassware, Etc.

For $6.95 we furnish a high grade, accurate, 4-bottle testing machine, one acid measure, pipette, two brushes, one bottle acid, and instruction sheet. Everything complete for testing.

Free Instructions Furnished

With each machine printed instructions are furnished which are plain and simple. A child can make the tests. Write for Big Dairy Catalogue.

SOPHIE'S AGNES, TYPICAL OF THE INDIVIDUALITY OF THE AMERICAN-BRED JERSEYS ON AYREDALE STOCK FARM, MAINE. SHE WAS THE FIRST COW OF THE BREED TO MAKE 1,000 LBS. OF FAT IN A YEAR

American-bred Jerseys in Maine

"GOD and nature first made the Jersey cow for production. Her beautiful qualities to please the eye are a secondary consideration." These words form the basis upon which a great breeding establishment has been founded well up in Maine, far from the usual haunts of famous Jerseys. When F. W. Ayer said further of the breed, "The future development depends upon the fullest use of the animals that have proven their ability to transmit great production," he outlined the plan he has put in operation at Ayredale Stock Farm. There American-bred Jerseys are raised—a herd in which those Jersey qualities are developed which appeal to the American farmer who milks cows for profit. There progress is measured, not by form alone, but by the standard of the text, "By their fruits, ye shall know them."

At Ayredale have been brought together representatives of the best production families. The herd throughout probably excels any other of the breed in average productive capacity—fulfilling the testimony of a recent breeder-visitor that it is "the best herd of producing Jerseys in America."

Concrete evidence of the merit of the herd where Plain Mary, the breed's champion, was owned is found in the Register of Merit work now being done. One hundred sixty-eight records completed average 10,594 lbs. milk, 588 lbs. fat. More than half of these were made by cows not yet mature. Forty yearly records made in 1920 average 10,481 lbs. milk, 586 lbs. fat, almost half of them being made by heifers with their first calf. In January, 1921, five cows completed records averaging 11,000 lbs. milk, 628 lbs. fat.

The sire to which these cows are bred is Carry-on of Ayredale, whose dam and two grandams have an average of 17,151.1 lbs. milk, 928.3 lbs. fat. He is a grandson and a great grandson of Sophie 19th of Hood Farm, his dam being Sophie's Bertha, ex-champion junior three-year-old, with three records, all begun at less than mature age, averaging 14,799.7 lbs. milk, 825.3 lbs. fat.

Ayredale Jerseys have size, capacity, and the inherent vitality to stand up under hard work. They have plenty of spread for handling much feed, with capacious middles; deep, wide chests; and large udders full of active, healthy tissues for the manufacture of milk. They have keen appetites and the ability to make a satisfying accounting for all feed consumed. They are cows of marked energy and vigor. At Ayredale are Jerseys without daintiness, which are not delicate; cows neither fawn-like nor beautiful, in the sense of prettiness.

These cows have too much scale and substance to fit present day showing requirements; the fancier's demands are ignored for working form. Here are cows which have the stuff from which profits are made—the qualities necessary on the dairy farms of America.

Official Testing

HOARD'S DAIRYMAN:—It is with great interest that I have been following the various articles in your paper in regard to official testing and prompts me to contribute some of my own observations and opinions.

In the first place, when speaking of what is natural and what is against nature in regard to the dairy cow, we must use that term relatively only. For the modern dairy cow is not a natural cow but has been bred up by man's genius and selection, so that in many ways she does not follow the same laws her ancestors did when they roamed the fields. We know that in nature a female does not mature as early as in our dairy breeds, more so in some than in others, and no one would suggest breeding a heifer the first time she came in heat, though it is nature's outward sign that she has reached that stage of her development. Again, in nature in its wild state, the mating season came but once a year so that the young would always be born at the time when nature furnished abundance of feed. And cows in those days only gave enough milk to properly nourish their young.

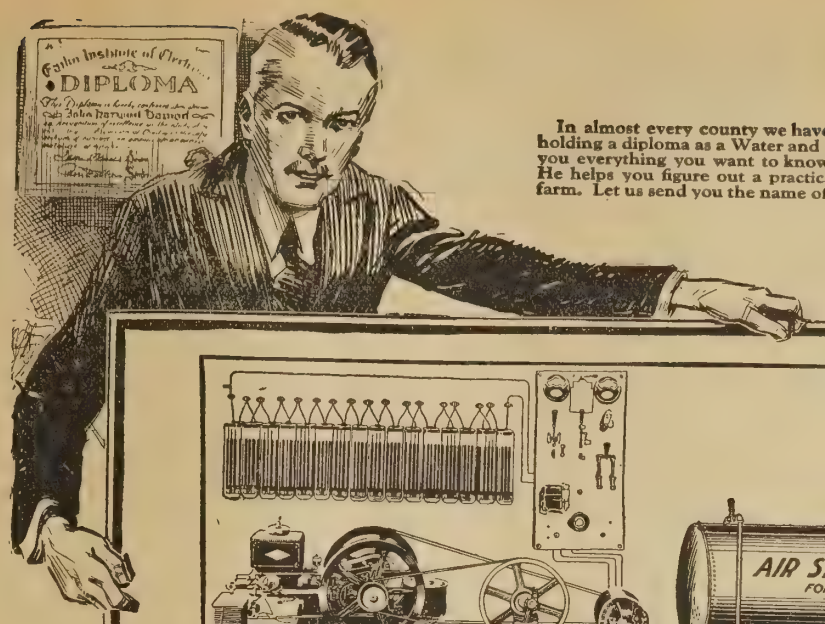
These things have all been changed to a great extent but with all we have learned some lessons, and we say it is against nature to do or not to do them. For instance, we have learned that if we put off breeding a cow after she has freshened we lessen the chances of her ever breeding again, and many a high producer has proved barren and thereby unable to transmit her good qualities through her offspring. Still breeders will persist in taking this chance and make a big record; they are sacrificing reproduction to production. This very thing has led one of our dairy breeds to adopt the slogan "a calf with every record" and it has been a great step in advance, but there is still the opportunity for

breeders to push cows through the year's record without giving her a resting period. I believe all will agree with me that, for a cow to be at her best year after year, she should have a resting period before dropping her young, and while there are some exceptions they only prove the rule. The rule is, that no cow has made a good Advanced Registry record several lactation periods in succession without having a reasonable resting period between each one. If this is true, and authorities seem to agree that it is, then why make arbitrary requirements for the Advanced Registry that do not conform with nature's limitations as they exist at present? There is only one logical answer and that is, a 305-day testing period with the requirement that the cow must drop a living calf within 365 days after entering the test.

You say that some one suggests that "the relative efficiency of cows would be measured by the time required to make the official requirements rather than the quantity of fat produced in a year." What are the official requirements but arbitrarily established figures that can be increased or decreased at any time without effect on the cow. A good many people have felt that the present requirements are not high enough, and my suggestion would be to leave the requirements where they are but have the cow make them in 305 days, besides a calf, as above suggested. I fail to see the logic in comparing a race horse with a dairy cow. The former is a creature of sport and used for that purpose only, the latter is one upon whom the human family depends for essential nourishment. Besides, what good would a horse be that could make a mile a minute, but could not do a full day's work in the harness? If the Advanced Registry rules were applied like that I am afraid that cows would be dry for two or three months, would be pushed to the limit without breeding them, to see in just how few days they could make the present A. R. requirements, even though they were dried off as soon as the test were finished.

The cry all along has been not how much will a cow give right after she freshens but how long will she keep it up. It is not always the cow that makes a lot the first month or two that rolls up the big totals for the year's work. We have to feed cows the year round, so why not keep track of their work, at least what is considered a year's work for the average dairy cow, viz., milk ten months, drying up and dry two months, then a calf? The trouble is, things are getting so now that unless a man's cows produce 700 lbs. fat or more per year, he is not considered at all.

Just a few days ago a breeder told me that A. R. records of 600 lbs. fat or less were worse than none at all. He has got good pure-breds, which would make from 400 to 500 lbs. fat on twice a day milking, but he veals his bulls just on account of such fool notions. I can take you to breeders who have world record cows and the majority of their herds look as bad as scrubs; a few cows are getting the care, and the rest can go hang. Is not the man who milks his cows under farm conditions and makes records up to 500 and 600 pounds of fat with calf, doing more good for the breed than the other man? This leads me to say just a word in regard to the number of times a cow should be milked. I cannot see any harm in milking a cow three times daily that is giving from 45 to 70 pounds of milk per day, and some of our heavy milkers should no doubt be milked four times. But I draw the line on milking a cow three or four times a day that gives only 5 and 6 lbs. to the milking, like some cases I know of. Such methods disgust the average farmer.



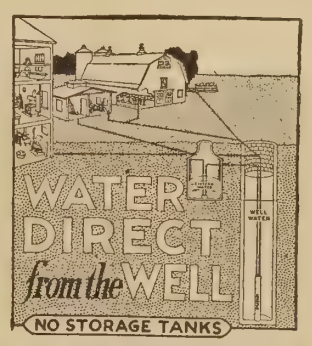
A few days ago I was looking through some of our breed papers and I re-read an article by one of the great constructive breeders of our country. I want to quote: "All breeds are bred for a distinct economic purpose and a breed stands or falls on its ability favorably to impress itself on and improve the non-pedigreed animals of the country, for when all is said and done this is the only excuse and reason for the existence of the pure-bred." All Advanced Registry records are made with the intention to prove the economic purpose and the individual merits of the different breeds and to recommend them to the man who milks just cows. If we let these truths lead us we cannot err in selecting the 305 days' test period.

Oregon. OCTAV VOGET.

Jersey Cattle Notes

For week ending March 4:

Number of animals registered: Bulls, 245; cows, 677; total, 922. Number of transfers recorded: Bulls 191; cows, 499; total, 690.



The Expert Explains How You Run Your "Milwaukee" Water System

The above is the only equipment you need with a Milwaukee Air Power Water and Light System—simple, easy and economical to operate, sturdy and lasting. In addition there is only the pipes and the pump at the *bottom of the well.*

You can also run a Milwaukee Lighting System from the same power—installing now or at a later date.

Notice that there are no water storage tanks. Water stored in tanks becomes stale, unrefreshing, loses a great portion of its benefit. Your Milwaukee Water System will deliver water to your house, barns and troughs always fresh, cool, pure, refreshing and beneficial.

Our big new illustrated book tells you what you should know about water systems—and what other farmers think of them. Write us for this free book and the name of the water and light expert who lives near you.

Cream City

SANITARY MILK CANS

"The cans with the strong straight breasts"

will give you the best of service because they have NO WEAK POINTS. Like a chain, a can is no stronger than its weakest point.

Cream City Cans ARE DURABLE, very durable, SANITARY, Heavily tinned and retinned. Of correct capacity 8 Patterns

All parts are heavily RETINNED after being made up
All seams are smoothly flooded with solder
The weight of the can rests on the shoulder of the bottom hoop. No strain on the rivets
The body of the can is of heavy enough stock to stand the wear and tear of daily use
Strongest possible concealed or open breast hoop construction
Breasts cannot be dented easily, due to this strong STRAIT BREAST Construction

Association Notes

Salem County, New Jersey:—The majority of farmers purchase their feed through the South Jersey Farmers' Exchange, an organization owned by the farmers. Home grown corn, ground into corn and cob meal, enables the farmers to keep the cost of their rations down reasonably. The average cost of the grain ration for February was $2.26 per cwt. Unprofitable cows are sold for beef. Veal calves bring 14c per lb. The secretary of the Salem—Cumberland Holstein-Friesian Association is of great assistance to the farmers in supplying them with good bulls. Several herds in the association are being tuberculin tested. February market milk testing 3.5% sold for $2.92 per cwt. and 4c per point above. Hotel milk sold for 10c to 12c per quart. Feed prices are: Silage, $8.50 per ton; alfalfa, $30; clover, $28; mixed hay, $25; gluten feed, $48; linseed meal, $50; cottonseed meal, $45; dried brewers grains, $45; beet pulp, $45; bran, $38; hominy feed, $33; corn and cob meal, $27; oats, $40.

Barnesville, Ohio:—February market milk testing 3.5% sold for $2.70 to $3.20 per cwt. and 5c per point above. Feed prices are: Larro, $2.75 per cwt.; bran, $2.10; oil meal, $3; cottonseed meal, $3; hominy, $2.25; beet pulp, $2.50; gluten, $2.75; oat middlings, $2; Cow Chow, $2.70; oats, 70c per bushel; corn, 90c.

Unity, Wisconsin:—Purchasing a carload of mixed feed co-operatively at a saving of $200 resulted in a reduction in prices of feeds by the local dealers. Three members are A. R. O. testing with fine results. Farmers' institute was well attended. A three-reel picture on the Babcock test and one on Ayrshire cattle were shown. Two unprofitable cows were sold during February. Market milk testing 3.6% sold for $2.30. Milk retails for 10c per quart, butter for 53c per lb., and cheese for 23½c per lb. Feeds sold as follows: Gluten, $38—$55 per ton; bran, $28—$33; oats, $29; barley, $30; oil meal, $45—$50.

Luck—Milltown, Wisconsin:—A meeting was held during February for the purpose of determining the actual cost of producing a pound of butter in the two local creameries. This association is "one hundred per cent" in the use of pure-bred sires. All but two of the 55 members have silos and water systems. Two carloads of feed were ordered.

Polk County, Wisconsin:—The last scrub bull has been sold, making this association "one hundred per cent". Eleven unprofitable cows were sold during February. The creamery paid 51c per lb. for fat. The following prices were paid for feeds: Silage, $6 per ton; hay, $12; oats, $25; barley, $27; corn, $18; bran, $32; oil meal, $48.

Amery, Wisconsin:—Several members have fed ready mixed dairy feed, but find that they prefer rations prepared from home grown feeds. Members feeding only timothy and wild hay are beginning to realize the importance of having some legume hay. All members deliver their cream to a creamery. During the first eight months of the association year 28 unprofitable cows have been sold.

Ellington, Wisconsin: — During February two cows were sold for beef and 23 for dairy purposes. These 23 cows were not of the best in the association, as farmers know that cows whose values are proven are hard to replace, therefore the best animals are kept in the association. The condensery paid 41.6c, the creamery 48c, and the cheese factory 58.8c per lb. for fat. Milk retails for 12c per quart. Bran is rated at $30 per ton; middlings, $29; oil meal, $46; gluten, $54; cottonseed meal, $50; clover hay, $16; oats, 42c per bushel; barley, 60—65c; corn, 65c.

Blue Earth County, Minnesota:—Several unprofitable cows were sold in February. The owner's profit from his herd is as large without these cows, which proves that they did not pay their board. The installing of drinking cups in two herds and the feeding of better balanced rations has helped to increase the milk flows in the association. Milk retails for 10c per quart and butter for 53c per lb. The creamery paid 60c per lb. for fat. Feed prices are: Oats, $18 per ton; bran, $24; oil meal, $45; corn (shelled and ground), 45c per bushel; silage, $6 per ton; clover hay, $18; alfalfa, $18—$20.

Knox County, Illinois:—Three pure-bred bulls of excellent breeding have been purchased recently by members. Nine members are keeping daily milk records of their cows and none are using grade or scrub bulls. At present over 50 per cent of the cows in the association have been tested for tuberculosis, and 34 reactors were shipped to Chicago during February. Mr. A. R. Landon, a pioneer in his association, has been made a member of the Dairy Committee of the Illinois Agricultural Association. Market milk testing 3.5% sold for $3.25 per cwt. and 5c per point above. The condensery paid 48c and the creamery paid the same price per pound for fat. Milk retails for 15c per quart and butter for 50c per lb. Feed prices are: Corn and cob meal, $1 per cwt.; ground oats, $1; wheat bran, $2.15; oil meal, $58

per ton; cottonseed meal, $49; Cow Chow, $34; molasses, $38; alfalfa, $22.50; clover, $18; corn silage, $5.

Monona — Farmersburg, Iowa:—This month there were 62 cows on the honor list as producing over 40 lbs. fat, as compared with a maximum number of 30 for any month last year, and a maximum of 21 for any month the year before.

Riverside County, California:—The five highest cows for February average a production of 77.54 lbs. fat. N. L. Browning has two pure-bred Holsteins which gave him a herd average of 74.04 lbs. butterfat. Four per cent milk sold for $4 per cwt. in February. Milk retails for 16c per quart, butter for 60c per lb., and cheese for 35c per lb. Feed prices are: Bran, $44 per ton; coconut meal, $40; cottonseed meal (40%), $40; beet pulp, dried, $48; ground barley, $38.

A Washington Association Finished Fourth Year's Work

The Stillaguamish Valley Cow Testing Association, Washington, has finished four years of work. Of the 792 cows tested during the past year, 475 completed the year with the following averages: milk production, 6,715 lbs.; butterfat production, 292.4 lbs.; value of product, $204.97; feed cost, $107.53; return over feed cost, $97.44. A herd of Guernseys owned by Valley Gem Farms reached the highest average production, the 24 cows averaging 412.4 lbs. fat and 8,870 lbs. milk. Valley Gem Farms also own the four highest fat producers and the three highest milk producers. The tester, Mr. M. C. Hong, makes the following observations: "The six highest herds have been testing continuously since the association started four years ago. They have also had a pure-bred sire at the head of the herd. Of the six lowest herds, four have tested for the first time last year, while none of them have tested more than two years. The ten high cows for butterfat production are from herds that have been in the association for four years. It may be stated that four of the cows in the high herd were on semi-official test, and were milked three times a day for nine months. However, to offset any advantages that may have been gained in this way, there was a loss of feed and barns by fire over three months before the testing year was finished.

An example of what may be accomplished through testing and right breeding is furnished by William E. Pew, a cow tester in Ohio. He cites the accomplishment which has been made on the farm of Mr. R. H. Anderson in the period of four years. In 1916 Mr. Anderson's herd included "all kinds of cows". The first registered Jerseys were purchased in September, 1917, when the results of the cow testing association had indicated the need for better cows. One of the animals purchased, Homestead Dairy Queen, now on her second year of testing, is producing an average of 70 lbs. monthly. Eighteen Register of Merit records have been completed and ten more cows are on test at this time. Of the two-year-olds which have finished their records, only one has made less than 400 lbs. fat. "This," Mr. Pew says, "is only one example of what has been accomplished in three years by starting right and breeding and testing for better cows, because only by testing can one determine the kinds of cows he owns."

With spring house cleaning at hand, the farm woman who hasn't running water in the house casts envious glances at her more fortunate neighbor. Keep at the men folks.

Is your sink 36 inches high? Most kitchen sinks are so low that they cause endless discomfort and back strain. "Standard" kitchen sinks have adjustable legs, so that they can be set from 32 to 36 inches high, as desired. Measure height of sink from top of rim to floor.

Write today for copy of catalogue "Standard" Plumbing Fixtures for the Farm." It is illustrated in colors, shows many styles of sinks, complete bathrooms and fixtures, model kitchen and laundry.

Standard Sanitary Mfg. Co., Pittsburgh

A Successful Milk Company

HOARD'S DAIRYMAN:—In looking over the reports of prices for milk in different towns and cities I do not see any that is any better than our own in Connellsville, Pennsylvania. Our plant is owned by the Farmers' Co-operative Co. Stock was sold to farmers who were milk producers, the company agreeing to take all their milk and pay on a butterfat basis. The company rented a suitable building, put in a pasteurizer, milk cooler, refrigerating plant, and separator and churn. It sells milk, cream, cottage cheese, and butter and in January paid the farmers $4.41 per 100 lbs. for 4 per cent milk. Instead of 12 or 14 wagons going over the same route daily, 3 make the deliveries and a better grade of milk is furnished. The plant did a business of over $56,000 last year which was our first in business. We would not go back to the old way of selling to dealers who would stop their supply when milk got cheap and plenty and some one come along and offer it at a lower price. We retail milk at 17 cents a quart which is a higher price than many towns are paying, but we try to give them a good milk and good service. We find co-operation among the farmers pays as the state of Pennsylvania is buying fertilizers this year for the farmers and we are to have 16 per cent phosphoric acid for less than $17 a ton instead of $31 asked by dealers.

Pennsylvania. W. W. M.

The Farmer's Concrete Mixer

SHELDON Batch Mixer

Mixer Parts $14.20 up — Complete Mixers $29.85 up

Build for permanence. Put a SHELDON Mixer to work on your farm. Saves time, labor, money. Takes the backache out of concrete. Gives you a better job. Sheldon is the pioneer builder of mixers for farmers. Thousands in use now on farms —in every state. Buy a Sheldon. Build your own concrete tanks, feeding floors, silos, foundations, etc., at a big saving. Costs only $16.80 and upward. Write for book.

Read What These Sheldon Owners Say

It is the greatest labor saver I have on my farm. Two men can do ten times the amount of work in one day and do it ten times easier than the old way.—HARRY L. WALLACE, Jeromeville, O.

The machine I bought of you in 1916 has given continual service to date *without a single repair*, and at present needs only the small cast wheels that support the drum, and their supports.—ASA A. GOBLE, Huntington, Ind.

Owing to the scarcity of labor the machine is practically indispensable in making farm improvements with concrete.—J. McGRARY, Massena, N. Y.

I am more than busy with my Sheldon Mixer. I have more work than I can do. I get $10 a day when I work out.—JESSE L. WITTER, Wellsville, N. Y.

Last spring we purchased a set of castings to make a concrete mixer. It was constructed per the plans furnished and *it surely worked great.*—D. M. BRUBAKER, Freeport, Ill.

George Hanig of Ackley, Ia., writes that he "put through" 106 yards of concrete in 21 hours. That's more than 40 cubic yards for an eight-hour day.

FREE PLANS

Make your own concrete mixer. Costs so little you can't afford to mix by shovel. With our iron and steel parts we send Free Plans and a permit for building your own. Or, we will sell you a built-up machine, at a very low price.

You Can Make Big Money at Concreting

If you buy a Sheldon Mixer for your own use you can make many times its cost in a season by renting it to your neighbors. Or, if you want to go out with it on contracts, you can easily earn $10 to $20 a day. Sheldon owners are doing it right now. The jobs go to the man with a Sheldon Mixer every time. A profitable side line for spare time.

30 Days Trial! Write for Catalog!

Our special 30-Day Trial Privilege absolutely protects you. Write for details. Get our Free Catalog showing full line of mixers sold direct from factory on strong guarantee. No others like it. Two styles, hand and power. Mixes 8 cubic feet a minute. One man can operate it, but it will keep 2 to 6 men busy. Continuous chain drive. Tilting discharge. Easily and quickly moved. All parts guaranteed. Does work equal to $400 mixers. Get the catalog and full information. Write today.

FREE! Concrete Book

Get our new 176-page Book on Concreting. A real text book written by an expert! Gets right down to A. B. C.'s. Contains detailed instructions, tables plans, and cross sections—132 illustrations. Invaluable to any man in planning construction. Free, postpaid, when you buy a Sheldon. To others, $1.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Aermotor Towers are Towers of Strength

Warm, dry, comfortable stall floors of Circle A Cork Brick in the barn of the Ingle Investment Co., Winslow, Ind.

Cows Are Like Folks

COLD effects cows very much as it does humans. It lowers their vitality, decreases production and increases susceptibility to disease. The most penetrating and harmful cold comes through the floor, since it effects the least protected and most delicate parts of the animal's body. Cold floors, therefore, are unprofitable floors.

Ⓐ Circle A Cork Brick Ⓐ
FOR STALL FLOORS

are warm to the touch—summer and winter. Hence, a floor of Circle A Cork Brick prevents chilling and lowered vitality. It keeps cows comfortable, increases their milk production and protects them from garget, rheumatism and stiff joints. Being also sanitary, non-slippery and durable, a floor of Circle A Cork Brick has money-saving and money-making features which the dairyman and breeder cannot afford to overlook.

The vital importance of warm, dry stall floors is interestingly explained in the 28-page book, "Better Stall Floors," which, with a sample brick, will be sent free on request.

Putting Life Into the Soil

HOARD'S DAIRYMAN:—You no doubt have seen soil that was lifeless, it may turn up in fairly good condition, but after it has been worked a little and cultivated it lacks the looseness and loamy character that it should have and crops do not thrive well on it. A little humus forming material added to it not only increases its productiveness, but gives new life to it. Every farmer has observed the results of plowing under any vegetable matter and will find it worth while to go into the reasons for the change to the better in the soil.

Humus is rotted vegetable matter. There are a number of ways to get this humus into the soil. We don't have to rot material to make humus, the soil is benefited more by having this vegetable matter decay on or mixed in with the soil. A ton of straw rotted in the soil will improve the texture and fertility of the soil much more than will the simple addition of a ton of already rotted straw.

I have seen this proven a number of times, and the results are more marked in clay ground. Perhaps that is because the clay gets a little tighter than does our black ground which makes the effects of added vegetable matter more noticeable. Some of our clays given as much as three or four tons of fresh straw, wheat or oats or rye straw, and soy bean or clover chaff undergo a great change when the straw is worked into the soil, and make the difference between an unprofitable and profitable crop. The results of the addition of the straw can be seen for several years in the finer texture of the soil.

It is usually the crop on the clay ground that suffers most in periods of drouth. Where we have added a few tons of humus forming material and it has rotted in the soil, the crop will stand more dry weather than where the vegetable matter has been omitted. It will retain moisture longer and hold more moisture, and this advantage often means the difference between success and failure. If the soil has been neglected or is pretty well run down a great deal more vegetable matter will be needed and should be provided. A neighbor got splendid results by discing and plowing under four to five tons of very strawy manure, planting to soybeans, threshing the soybeans, and then putting the soy bean chaff back on the ground. By sowing a little less than a hundred pounds of acid phosphate with his corn, he got a much better crop of corn off that clay soil than had been raised there in years. Humus was no doubt the foundation of success with that soil.

I have noticed also that where our clay soils are tilled they respond better to the addition of humus. The decay of the straw or whatever is used is more rapid. They warm up a little earlier, because they are looser and absorb the heat of the sun and air faster. When you turn up a clay that crumbles behind the plow and the loose dirt runs back down into the furrow you are pretty sure to have a clay in good tilth, that will hold moisture and warm quickly.

It is an accepted fact that if we removed all the humus from the soil we would have only mineral matter such as finely ground rock, so it will be seen why the humus is what gives "life" to the soil. Every time we grow a crop of corn, hay, or wheat some humus is added to the soil through the stems and leaves left on the ground and the roots in the soil, but these are not sufficient.

One of the best practices we can make is to get all the humus in the soil we can, consistent with good farming methods, plowing under straws, manures, grass, and stalks. Clover

Abortion

due to a germ infection is prevented and eliminated from the herd by treating with

B-K Bacili-Kill

B-K kills these germs without irritating the tissues and restores the reproductive organs to normal. It is a very powerful disinfectant, a pure sodium hypochlorite that many Veterinarians and doctors prescribe—well known to most scientists and used by the best breeders for years.

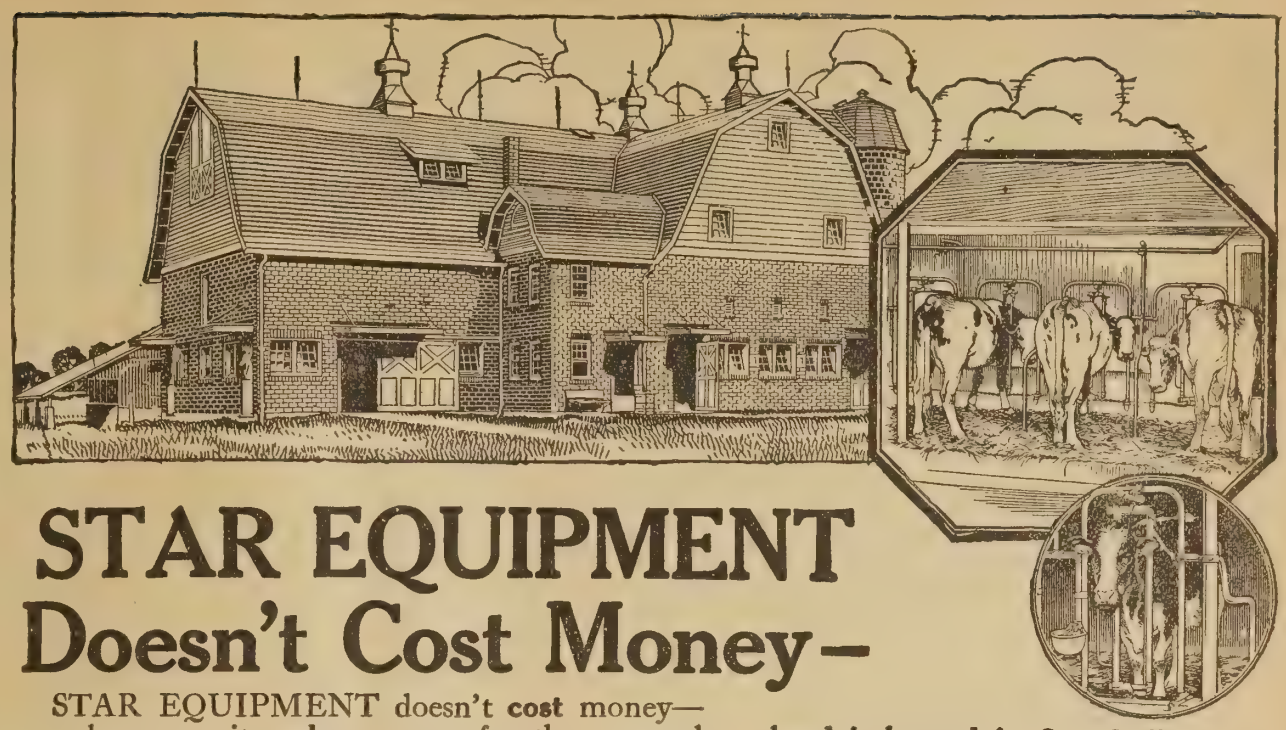
sods are very valuable, the rotting roots opening the soil and loosening it in a most desirable manner. Alfalfa and sweet clover roots go deep into the soil and leave, when turned under, a great mass of stems and roots that is soon converted into humus by the action of bacteria working on it.

Indiana. J. L. JUSTICE.

Sunflower Silage

HOARD'S DAIRYMAN:—In your February 18 issue D. H. A. gives his experience with sunflowers for silage and you invite a report of the experience of others who have grown and used sunflowers for this purpose. I am therefore offering my experience with the crop.



Sunflowers have been grown in Minnesota for the past three or four years as a crop that would escape frosts and that would give a satisfactory silage product. To learn the value of the crop it has been grown at University Farm in comparison with corn. The crop has usually been planted between May 15 and 25, or just at the late corn planting time. It has been planted in rows 36 to 42 inches apart, using 16 to 20 pounds of seed per acre. The aim is to have the sunflower plants 2 to 4 or 5 inches apart in the row. The crop has been cultivated just as a crop of corn planted in drills would be and the crop cut for silage when well in blossom and when the lower leaves are beginning to dry up and fall off. Cut at this time it gives a sappy silage. Frequently liquid will drain out of the bottom of the silo but the silage has kept perfectly and appears to be of good quality. It is my belief that the late blossoming stage at least should be reached before the crop is cut for silage. It would be better yet if the seed were allowed to mature to some extent, though this usually results in quite a large loss of leaves and more dense and woody stalks.

The yield of silage at University Farm has varied from 8½ to 12 tons per acre. In this respect it compares favorably with corn as that is about the average yield of that crop over a period of years. Much higher yields are reported from other places. The weights at University Farm are accurate as every load put into the silo was first driven over the scales. Since sunflowers yield no more and make no better silage than corn there would seem to be no particular object in growing sunflowers where corn can be successfully grown. Sunflowers proved a very acceptable silage crop in the northern part of the state where the season is shorter and where severe frosts come early in the fall. Yields in St. Louis County and Itasca County where the crop has been tried to some extent are slightly larger than they are at University Farm.

There has been no difficulty whatever in getting the cows to eat the silage. When first offered they sometimes hesitate but after a feed or two of the sunflower silage they take it as readily as they do corn silage and it seems to be quite as effective in keeping up the milk flow.

At the North Central Sub-station at Grand Rapids a silage combination has been made by mixing corn, sunflowers, and soy beans. The proportions are 3 parts corn, 1 part sunflowers, and 1 part soy beans, by measure. Of this mixture 20 pounds of seed per acre is sown. The result is a mixed crop with a somewhat larger yield than is obtained of either crop alone and a very desirable quality of silage. This mixture is highly recommended by Superintendent Bergh and I believe that others will do well to try it out. ANDREW BOSS.

Minnesota College of Agriculture.

STAR EQUIPMENT Doesn't Cost Money—

STAR EQUIPMENT doesn't **cost** money—
—because—it **makes** money for the man whose herd is housed in Star Stalls.

Healthier cows—cows that give more milk—less work for you and the hired hands to do—don't those things represent more money in your pocket?

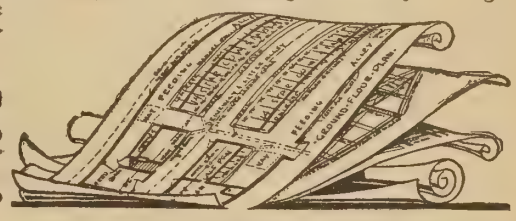
Well, that's what the STAR EQUIPPED barn means. Dairymen who have housed herds the old way and the modern way—the STAR way—say that the equipment pays for itself the first year it's in or soon after.

It isn't a question of whether or not you can afford it—the question is can you afford to be **without** it?

1—Star Alignment Device
Instantly lines cow at gutter after she is in stall—keeps stall, bedding and cow clean.

2—StarStanchionAdjustment
Narrows or widens stanchions to exactly fit cow's neck. Safety and comfort.

3—Star Curb Clamp
"Sets a stall in 60 seconds"—permits of concrete work being finished before stalls are set. Cuts time of installation in half.



4—Star Unit System Stall
Each stall assembled before shipment, ready to go in place the moment it arrives.

5—Star Wood Lining
Hard maple lining forced in U bar, anchored so it won't come out.

Soon Pays for Itself

On every item of STAR Equipment, you'll find patented features, exclusive with this line, that mean added convenience, longer life, labor saving and money making.

And there isn't a thing for the barn that isn't in the STAR Catalog in the best form imaginable.

Make Your Barn Modern

The Star Line is not confined to Steel Stalls, Stanchions, Water Bowls, Pens, Ventilation Fixtures, Litter and Feed Carriers, but also embodies Harvester Hay Tools, Cannon Ball Door Hangers, Hoghouse Equipment, Garage Door Fixtures, and all kinds of farm specialties. It takes a 320-page catalog to tell the Star story.

Your name will bring the finest catalog ever issued—a-320 page bound book worth owning for the useful information it contains. The only expense to you is the trouble it takes to write.

Barn Blue Prints Worth $10.00 FREE!

Made Especially for Your Needs

Just specify on the coupon below the number of cows, young stock and horses you want to house and the experts in our Plan Department will send you a practical blue print of elevation, floor plan and outside of a barn especially suited to your requirements. And it doesn't cost you a cent. This is our "get acquainted" offer. Mail this coupon. We'll mail the plans free.

EDITORIAL COMMENT

IS THE COW DOOMED?

There are those who believe that the synthetic method of making milk will replace the cow. Every few years new enthusiasts are found making this claim. They hold it is a simple matter to take the cereals and the roughage of the farm which the cow eats and convert them into milk. This has never been successfully done. A product has been produced which resembles milk but it has never had all the qualities and the refinement and the delectableness of milk. Leading scientists do not hold that there is any immediate danger of replacing the cow.

It is well known that for years scientists have tried to create life but so far they have not unravelled this secret. Since milk is so important to the welfare of the human race it may be considered a life-giving substance for without the properties characteristic of milk, proper growth of the young is not made. We can consider milk as wonderful a product as life itself. When scientists shall have been able to create life, then we will believe that science will be able to manufacture a product equal to milk from the feeds which the cow consumes. Until that is done, we will have little concern about statements to the effect that the scientist is capable of producing milk from cereals and roughages.

LESIONS ON POST MORTEM

A mistaken notion prevails concerning the evidence of tuberculosis as furnished by examinations for lesions of the disease in slaughtered animals. The presence of lesions is, of course, conclusive proof of a tubercular condition—but failure to discover lesions by no means proves the absence of the disease. Retest guarantees which require the finding of lesions as proof of the disease place too much of the burden of proof upon the purchaser and in no way constitute the guarantee implied.

In the first place, packing house inspection is made to determine whether or not meat is fit for human consumption—not to search minutely for lesions of tuberculosis in the small and inaccessible glands or in meat parts that cutting would injure. Microscopic examinations are impractical, and even they are not certain unless extensively made. Lesions in the parts not used for food may not be noticed, except when special examination is provided for. Moreover, it is now known that an animal may be tubercular without having lesions—that blood tests will evidence the disease in reactors in which lesions cannot be found. The fallacy of requiring the finding of lesions in animals which have been guaranteed is seen when it is known that as high as 15 per cent of tubercular animals may not have developed lesions. All reactors in which the disease is in its incipient stages are likely to show no evidences of tuberculosis upon slaughter. If the seller who has guaranteed an animal for retest is satisfied that the test has been properly administered, he can in fairness ask no more. To require the finding of lesions in the slaughtered animal makes the "guarantee" constitute no guarantee at all.

READJUSTMENT

Results of war are bad, and they affect the farm, the shop, the merchant, in fact, all industries. The greater the war the greater the disorganization of our economic conditions. Homes cannot be destroyed, land laid waste, industries turned toward the manufacture of munitions of war without disrupting our economic relationships. This period through which we are now passing is very similar to that which followed the Civil War. At that time prices rose beyond reason, then they receded rapidly, labor was thrown out of employment, prices of farm products declined until there was no money in farming. It does not seem possible at the end of a great conflict to return industries to peaceful pursuits, to the production of necessities of life, without passing through a period of depression when everything is out of alignment. At the close of every war there is a shortage of commodities that brings a demand which stimulates production everywhere. During the time of shortage there is opportunity for those who would demand the "pound of flesh". This condition creates discontent. The people strike back, attempting to save themselves from extortions. Then follows the period which we call readjustment, which means bringing about proper relationship between our several industries.

We are so constituted or have so little conception of providing plans to avoid these periods that they follow every war and the best way to pass through them is to accept the conditions as they are, knowing full well that in time we will be back to normal. What we need at present is greater confidence in all business activities. We should not be discouraged, for out of our present situation is coming a better understanding of our affairs and a more equitable relationship. Farmers everywhere are thinking and this means that changes will be instituted which will be of value not only to agriculture but to the nation as a whole.

BUYING SEED

The quality of the seed planted this spring will be one of the most important factors for the success or failure of the farm to produce a profit. We spend considerable labor and money in preparing a field for planting, and much of this is often wasted through carelessness or ignorance in sowing seed that does not grow well or that contains noxious weeds that will harry and worry us for years to come.

For some reason we are easy prey for the seller of "gold brick" seeds. He always promises phenomenal yields and extremely low prices. His "Splendiferous Oats" yield 150 bushels of 40-pound oats; his hay always goes ten tons to the acre, and the corn for silage never yields less than thirty tons. He is a master word painter and salesman, possibly because he does not feel bound by truth as is the man who expects the business next year.

A reliable seed house is under much expense to make sure of supplying its trade with good, clean seed that has quality in line with the best of the variety. We do not say that high price means quality. Price does not determine quality, good or bad; but quality does control price. What we wish here most to impress is, buy your seeds from reliable people. Buy the seed for your soil with the same responsibility that you feel in buying a bull for your herd. It is what your selection produces that makes the purchase wise or unwise, not the price. What we say of seed houses applies to individual growers. Know what you are buying and who it is from—then talk price.

When buying a seed mixture, know the relative quantities of the seed. If it is "alsike and timothy", don't be too certain the alsike predominates. Possibly the word has gone out, "spurlos versunken", and the alsike seeds will be conspicuous only for their few numbers in the midst of the cheaper timothy. Buy separately and mix, or get a guarantee of the quantities of each seed in the mixture. A sample of "mixed clovers and timothy" inspected by the Wisconsin Laboratory was found on examination to contain 16 per cent of the cheap and inferior annual yellow sweet clover. The really valuable clovers were not in the majority.

A. L. Stone of the Wisconsin Seed Inspection Service sends the following statement concerning a certain "bargain" seed house:

"A sample of red clover sent in to the Wisconsin Seed Laboratory by a Wonewoc farmer as coming from one of these companies was found to contain the seeds of buckhorn, Canada thistle, and wild mustard in the proportion of one noxious weed seed to approximately 170 crop seeds! Another sample from the same company, sent from Oconomowoc and labeled as mixed seeds, contained the seeds of quack grass, buckhorn, ox-eye daisy, Canada thistle, Indian and wild mustards—all noxious weeds! A sample of timothy from Janesville contained one buckhorn seed to approximately 879 timothy seeds, or at the rate of 99,717 per bushel. If sown at the rate of eight pounds per acre 7,032 buckhorn seeds would have been seeded per acre! Many more similar instances might be given, but these should make it plain that 'Bargain' seeds may be 'dear at any price'."

Look out for the new varieties sold at a long price. Some may be good and may fulfill their promise. If tried, make small seedings or wait until the price declines. If good, it will not be long before seed will be produced in sufficient quantity to reduce prices to reasonable limits.

We seem to be attracted by extremes in buying. We buy at a low price as a bargain, while a very high price whets our desire for something unusual. Either may be a good buy, but more often they are not.

CO-OPERATION AND KNOWLEDGE

We have long appreciated that the farmer working individually has not been in position to prepare and market his products to the best advantage. In our close study of successful co-operative enterprises we have been led to believe that if co-operation were developed to a larger extent there could be extended to the farmer such relief as he seeks in marketing his products. The trouble with co-operation is that not a sufficient number of farmers understand what it means to co-operate. Co-operation is not something to be adopted and accepted, but rather something to be learned and acted. Countries with the most successful co-operative enterprises have had the greatest obstacles to overcome. Necessity forced farmers to co-operate in some countries as there was no other way for them to succeed. At the present time the farmers in this country are turning their attention toward co-operative enterprises that they may improve the methods of marketing their products.

The president of a recently organized co-operative marketing company writes us: "Our affairs are not as satisfactory as I would like to see them for the reason that the farmer fails to see the economic adjustment period through which we are now passing, and I suppose blames conditions to his organization more than he should. But we are getting on a very sound foundation and I believe we are going to make a great success in the end." We believe if a survey were made among the men in this co-operative marketing company we would find that only a few members are informed upon the causes for the decline in the prices of farm products; that only a few thoroughly understand the economic forces which determine the market prices of farm commodities; that only a few know what a tremendous task it is to bring about a change in the handling of their products.

We know from investigation that this particular marketing company is organized upon a sound basis and it will succeed in its co-operative efforts if the members will inform themselves upon market conditions and what constitutes good business practices. Too much effort is being expended in complaint of conditions or circumstances, and not enough constructive effort is put forth to improve the methods of preparing and marketing farm commodities. It is not enough that a few leaders be interested in correcting the evils in marketing farm products, but a large number of farmers must also understand economic conditions and the principles upon which business is carried on. It is far easier to sit back and complain and find fault with those attempting to bring about improvement than it is to become an informed and active worker in bringing about the desired results.

Co-operation can only succeed when every member is willing to make some sacrifice and to do his part in making his organization a success.

Damages for Injury

A takes some stock in pasture from B without accepting any other responsibility. B sells farm and stock to C and most of them are left in pasture on same conditions. Shortly after one of the heifers comes with the milch cows to the barn and being in heat attempts to ride a cow just being milked inside the door. The milker gets up just in time to avoid being hurt and with his light pine milk stool raps the animal in the face. It rears out the door but slips on the wet planks and falls suddenly. It makes a quick jump to get up but falls back again. A veterinarian is quickly summoned but too late to do anything. He testifies that death was due to internal injury sustained in falli- and not the slightest mark is left under the skin where the blow was struck. The owner is called and told everything in detail. He gets the hide, free pasture for the remaining stock, and the veterinarian's service paid, amounting to about $18. He makes no further claim then, but over a year after he makes an additional claim of $40 on the grounds that A did "kill" that heifer. To what extent is A liable to C?

Polk Co., Wis. SUBSCRIBER.

We dislike, as a rule, to act as an arbitor in difficulties such as reported. This is not, as might first be assumed, because we do not want to take the responsibility for a decision but because in matters of this kind it is quite essential to get stories from both sides and all the additional evidence that is obtainable. There is often involved in such disputes a question of law and legal procedure which is a matter largely to be determined by a competent court; and when we see how often courts disagree, we fear the layman is quite likely to go far astray.

However, assuming that the information given is identical with that which could be secured by broader investigation, it is our opinion that A, on several counts, is not liable to any damage. As we understand, he merely allowed these cattle to be kept in his pasture with a definite understanding that he was not to be responsible in any way for them other than to furnish the pasture. It does not appear whether he received any remuneration for this, but it is doubtful whether even payment for the use of the pasturage would make any difference, providing it was understood that he was not to accept any responsibilty for such accidents or disabilities as might occur.

From the statements made, it would appear that the injured heifer was not maliciously handled by A and that he may have acted either in self defense or as any other individual might have acted under similar circumstances. It does not appear that even a blow might be given in anger that this was immediately and definitely responsible for the injury to the heifer. She might have fallen and slipped even when spoken to quickly or driven in any other manner from the barn. Added to all this, is the delay of the aggrieved C in seeking redress for the injury. Indeed, the acceptance of the tender previously made would seem to indicate that he was perfectly satisfied with the matter as it stood at that time.

It is our final conclusion that A is not liable to C under any condition. Indeed, we question whether there was any necessity of his paying the veterinarian's fee or allowing free pasturage to the stock, other than may have been dictated by his own desire to be more than fair in this matter. This opinion, as previously stated, is based upon a complete acceptance of the details as given.

Sorghum for Silage in Tennessee

Please tell me if corn and sorghum mixed make better ensilage than corn alone. What is the best kind of sorghum and ensilage to plant in Tennessee? Would it be better to plant the two together in alternate rows or in separate fields? Would the corn and sorghum both be ready for silo at same time if planted at same time?

Greenville, Tenn. W. E. N.

We see no advantage in mixing corn and sorghum for silage. In fact, we would prefer to seed these two forage crops separately and ensile them separately. This is because of the difficulty of getting the two plants to reach the proper stages of maturity at the same time, with both of them containing the maximum number of feed units that will permit of proper ensiling.

The particular desirability of the use of sorghum is that it will stand dry weather better than will corn. This will hold particularly true of the grain sorghums such as kafir, milo maize, etc. These are especially adapted to the drier sections of the United States and it is somewhat doubtful whether they would be suitable for growth in the state of Tennessee. The sweet sorghums, however, will do well in humid climates and, in some sections, are thought to make better growth than will corn. They will make an excellent grade of silage but it is doubtful whether it is superior to corn under most conditions.

Our suggestion is that the corn and sorghum be planted in separate fields and ensiled at the time when each reaches the proper maturity. For the sorghum, this is when the seeds are in the hard dough stage. The choice of varieties will depend largely upon those which do best in the particular vicinity and it is somewhat questionable whether it is desirable to introduce varieties from other states. In selecting a corn variety, we would take that which will produce the largest quantity of mature field corn and at the same time make the largest growth of stalk. The same would hold true as to the variety of sorghum to use.

Use of Complete Fertilizer on Sugar Beets

HOARD'S DAIRYMAN:—Sugar beets are chiefly grown on farms as a money crop. The success or failure in growing the crop largely depends upon the stand of beets and the yield harvested per acre. Yet it does not require much more effort to raise a good crop than a poor one, if a good stand is secured early in the season.

The writer made tests with commercial fertilizer which analyzed 2-7-10 on the growth of sugar beets which were planted on sandy-loam soil. The field was in potatoes the previous year and was plowed in the fall. The fertilizer was broadcasted on two plots May 25, then disced and thoroughly mixed with the soil. The beet seed was planted the following day. The commercial fertilizer was secured at $60.00 a ton.

The trials were made on acre plot basis as follows:

	Cost of Fertilizer
Plot 1—Check, no fertilizer	
Plot 2—2-7-10, 810 lbs.	$24.30
Plot 3—2-7-10, 660 lbs.	19.80

	Root lbs.	Leaves lbs.	Total lbs.	Increase roots lbs.	Increase leaves lbs.
Plot 1	20049	7248	27297		
Plot 2	29199	15903	45102	9150	8655
Plot 3	26326	10920	37249	6277	2672

The beets were sold at $10 a ton to sugar factory F. O. B. on board of cars at the nearest loading station. On the second plot, there was an increase of 9,150 lbs. over check or a gain of $21.45 over cost of fertilizer. On the third plot there was an increase of 6,277 lbs. of beets over check at a gain of $11.57 over cost of fertilizer. There was also an increase of 5.66 tons of sugar beet leaves on the two plots due to the use of commercial fertilizer. It will also be noted that on plot two 22½ tons of roots and leaves were grown, while on the Check only a little over 13½ tons were raised.

Wisconsin. J. F. WOJTA.

Why Silage Spoils at Bottom of Silo

I have a ten-foot silo with 20 feet above ground and a 6-foot pit. This year my corn was well dented when a light frost hit it. I used three men inside of silo and ran ½-inch stream of water into the distributor pipe at elbow. Silage was of the best until we reached two feet from top of the pit, when it started with moldy spots and got worse as we went down. At 2 feet from bottom it is 90% moldy. The pit is plastered with two coats of mortar and the bottom is a kind of hard pan. Please advise if you or any reader of Hoard's Dairyman can tell how I can insure against this in the future.

Nampa, Ida. L. P. B.

The reason for the formation of mold at the bottom of the silo is seemingly unexplainable from the information given. The general rule for avoiding mold is a tight receptacle, corn in such condition that it will ferment in 24 hours, proper distribution in the silo, thorough packing, and a silo with straight sides which will permit the silage to settle evenly.

The majority of molds, and possibly all that are deleterious, grow only in the presence of air. The spoiled silage may be due to the difficulty in moistening the first corn ensiled either because sufficient water was not used or because the corn would not readily absorb moisture. Fermentation in this case would not take place quickly and so sufficient air was left in the silage to permit mold to start. Indeed, for proper fermentation there seems to be nothing that will quite take the place of the natural juices of the corn.

Another possible cause, particularly if the spoilage was at the outer part of the silo, may be due to the fact that the pit is not perfectly circular or else may not be joined to the super-structure so that the two walls are even one with the other. We have known of several silos of the latter character where there is always a considerable spoilage from the opening of the pit and down for a considerable distance.

Definite explanation of reasons for silage spoilage in given cases is difficult. If any readers have had the experience noted above we shall be pleased to have them write us.

A West Virginia Pasture

I have about 5 acres of sandy loam hillside with a southern slope. It hasn't been tended for twelve or thirteen years but has been pastured every year. This is very good soil, but it is grown up in bushes and briers. I wish to get a set of grass on this piece of ground this year.

Nolan, W. Va. G. D. H.

If the land is steep hillside best results will be secured by cutting off the briers and brush, burning this and then seeding to 1 lb. of white Dutch clover, 5 lbs. Canadian blue grass, 3 lbs. alsike clover, 5 lbs. Kentucky blue grass, 7 lbs. orchard grass, and 2 lbs. of redtop per acre. If the ground is not too steep to harrow, such operation will help to cover the seed. Excellent results have been obtained without any covering at all, simply seeding the above mixture in ashes or other trash that remains after burning the brush in early spring.

If the land can be plowed to advantage without danger of washing, the above mixture may be seeded in oats and harrowed in, but not plowed in. If the shovel plow is used in preference to the harrow because the land is too steep and rough, I doubt the advisability of breaking it at all

If desired to pasture lightly the same year as seeding, or to get a crop of hay from this next year, there might be added 3 lbs. of red clover and 4 lbs. of timothy, reducing some of the other grasses in case the seeding is made with oats—otherwise I would not add the red clover and timothy. Seeding in the last working of corn has been successful in a number of cases but is not to be preferred to the above plan.

West Virginia College of Agr'l. D. R. DODD.

Dehorning and Showing

I have a yearling Jersey bull that is a fine individual and promises to make a good show bull. Would it injure his sale to take his horns off? Would it be a serious drawback to him in the show ring?

Rolla, Mo. H. E. B.

Show ring standards, particularly for Jerseys, pay more or less consideration to the horns. While most judges will say that they are not influenced by the absence of horns, yet when horns are taken off, it narrows the appearance of the head and the animal does not show up quite as well. Of course, if the horns are poorly placed or coarse in quality, it would be preferable to remove them.

If we expected to show this animal or hoped to sell him on the basis of conformation rather than the records of his ancestry, we would hesitate to remove his horns unless it became essential.

Comparing Carbohydrates

Please tell me what is the analysis of molasses and how does it compare with corn and barley, with barley selling at $.60 a bushel, corn meal at $1.65 a cwt. and molasses at 2 2-5 cents per pound.

Appleton, Wis. A. B. K.

In 100 lbs. of blackstrap molasses, there are about 58.2 lbs. of carbohydrates and 1 lb. of crude protein, making the total of digestible nutrients in 100 lbs. equal to 59.2 lbs. In 100 lbs. of corn meal there are 6.9 lbs. crude protein, 69 lbs. carbohydrates, and 3.5 lbs. fat, making the equivalent in total digestible nutrients, 83.8 lbs. Barley is somewhat lower than corn, having 9 lbs. protein in 100 lbs., 66.8 lbs. carbohydrates, 1.6 lbs. fat, and an equivalent of 79.4 lbs. of digestible nutrients.

From these analyses, a feeder can judge the value of these three carbohydrate feeds from the standpoint of their nutrient contents. At the present market price, corn is a very cheap source of carbohydrates. We question whether it can be substituted to advantage by either of the others. At the prices listed it is considerably cheaper.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Farm Bureau Signs

The American Farm Bureau Federation announces that it has adopted an official farm bureau sign and also an official farm bureau button. Any member who is interested in either the sign or button may secure it through his state farm bureau federation.

Whey Butter Experiments

Whey butter is not in good favor with many and Wisconsin has recently re-affirmed its legislation requiring that it be labeled. There are many who hold that this is discrimination, that whey butter is of like quality and keeps as well as creamery butter.

To determine the quality of these two butters the Wisconsin College of Agriculture is conducting an experiment, as follows: Four thousand pounds of whole milk will be divided into two lots of 300 lbs. and 3,700 lbs. The 300 lbs. will be used for the manufacture of butter; and the 3,700 lbs. for the manufacture of cheese, the resulting whey to be skimmed and the whey cream to be made into butter. This process will produce two ten-pound jars of butter which can be scored and compared in keeping quality. The experiment was started early in March and will be repeated at frequent intervals so as to permit of several comparisons.

Professor Sammis extends an invitation to interested parties that they will be welcome to investigate the work at the Dairy School in Madison at any time. The several lots of butter will be judged at the scoring exhibition on March 29th and the results then published. He would welcome suggestions or questions about this experiment.

Milk Horizon Brightens in New York

HOARD'S DAIRYMAN:—The past six months have been about the most trying that dairymen have had in a considerable share of League territory, but it has brought out the fact that any persecution at all possible for dealers to put upon farmers cannot break their spirit, or their pocket books entirely. I do not know how many co-operative plants have been developed from this hold-up by the condenseries, but you will find many of them. In some cases old buildings have been purchased and fitted up, and milk has been handled in various ways. The farmers have lost money where they have had to manufacture, but they have stood the loss remarkably well. In certain places they have finally been able to get in position to get as much or more than is asked by League price. Today there are few places where such concerns as Nestle's can get farmers to deliver League milk to them any more than has been done all winter. Nestle's now pay substantially the same as the League asks, but they are referred to the League to buy.

Some curious conditions come out of it. In one town the Nestle's price is higher than the League, but the local League refused to sell unless the milk was bought in the regular way through the League. In another town the dairymen had worked hard and secured a market that brings them more than the League price, but the dealer decided to buy milk of the League and did so. As it was the Borden Condensed Milk Co. that wished to buy for its many plants, it was necessary to sell this milk even though the farmers of the one locality might have realized more for it. The local men agreed at once that it was proper that the League sell the milk and they commenced to deliver it on the first of the month. It left them in bad just a little, for they had a debt to face, but some way will be worked out to meet that. In another Nestle's town where the League could not sell but the company offered to pay rather more than the farmers could realize from operating the plant, only one patron changed to the Nestle's and in turn they lost two others.

We have a report that seems authentic that this company has now asked for a hearing with the directors of the League. Many things indicate that those concerns who have carried on the siege for months have had enough of war and would like to make peace if they could do it gracefully and save their faces. As I understand it, all the leading concerns save one have indicated that they will not oppose pooling when the time comes to put it into effect. I know nothing of the time when this is likely, but if I were to make a guess it would be May first.

We are almost to a certainty so near to pooling that we better think of what that means in many ways. One of these is that an entirely new business of such gigantic magnitude cannot run with absolute smoothness at the first send-off. Let no man expect it. I don't know where the hitches will be found, but they will be found and they will cause annoyance. The fellow who opposed will have the chance of his life to say, "I told you so. Take your medicine." All the same, we are going to take the medicine and will get a permanent cure. The man who has hindered in the recuperation may have a chance to want some of the medicine yet for himself. If he does, he ought to be made to pay for it.

I do not know what is to be the attitude of the League toward the opposition. It may be left to the locals to deal with them, for the local people know the conditions. It may be that ignorant and misguided men who are poor have been led to oppose and some of them are entitled to some sympathy. In many cases men of education and of wealth have done most to hold off the campaign. It would only be just that such pay the price before they get under cover again. They have caused heavy losses to many who could hardly afford to take them, and have done it with all possible opportunities to inform themselves. Some of these have seemed to hold that they could dodge in when the thing became sure and not be under the necessity of taking any of the risks. It would be justice to let these pay well if they conclude to come along with the rest. We do not want to create antagonism but we do want justice.

Since writing the foregoing, the League has sent out an estimate of April first when we may expect to see pooling in operation. They are in much better position to know than I am, and my estimate of May first may as well be discounted. From my own horizon my guess is good but from theirs it may be bad.

New York. H. H. LYON.

Health of the Herd

Every stock keeper is vitally interested in the health of his herd. His profit may be determined by this factor alone; and, as an ounce of prevention is worth a pound of cure, it is well to look ahead and plan to avoid loss.

We are making splendid progress in fighting the dreaded tuberculosis and if we can keep up the fight we have reason to expect a large reward in the future. Having had experience for many years in fighting bovine tuberculosis, I have some ideas which may be of value. In buying stock, see that it is tested, and then fol-

Cows That Pay

SKILLFUL dairymen endeavor to get a full yield from their cows at the least possible cost for feed and most of them do it with a corn protein ration.

One of many examples is a test of two lots of nine cows each, both averaging the same milk yield at the start—and the cost of each ration was practically the same.

Both received the same amount of feed per day, yet one lot produced 50% more milk for 131 days—on account of only 4⅓ lbs. of corn gluten feed per cow daily being substituted for 4⅓ lbs. of corn.

Douglas Corn Gluten Feed is the best protein feed for dairy cows. Mix 10 to 15% of Douglas Corn Oil Cake Meal with it and you have the embryo proteins in your dairy ration, like you used to get them in distillers grains.

Douglas Corn Gluten Feed is practically equal to Oil Meal and Distillers Grains when fed as a supplement to clover hay and corn meal.

We have interesting booklets and circulars about our feeds, which we will be glad to mail free to feeders on request.

Tell us what kind of stock you are feeding and how many, also what feeds and roughage you have. We believe we can help you.

Order these high-grade feeds from your dealer.

Address Feed Department

Penick & Ford, L'td., Inc.

Manufacturers of Sugar, Cane and Corn Products

low this test in sixty days with a retest. Test your own herd at least once a year, and absolutely keep reactors out. Fresh air and sunshine in the barn are important items of prevention, and good ventilation is essential. A cement floor and open steel stalls make a safer barn and allow for circulation of the air. Closely boarded pens, where neither light can get in nor air circulate, are dangerous, hard to keep clean, and are too apt to harbor disease germs.

The water tank should be emptied often; never use a float valve; it is the best way in the world to encourage a filthy tank. Make it necessary for someone to go each day to the water tank and turn on the water. This will insure inspection. Arrange for definite days to clean and scrub out the tank; use a little copper sulphate solution in the last water, which will prevent green slime and will disinfect the walls and bottom of the tank.

There are a great many other ailments which are liable to affect the dairy herd and cut into the profits. Many of these troubles can be avoided by using a little care. Udder blemishes are often caused by allowing some vicious animal with sharp horns to gore the various members of the herd. Don't be sentimental; cut off the horns if this is the case. It will be humane and certainly more profitable. Many udders are damaged by poor stalls, causing the animals to have difficulty in lying down or getting up, when they are liable to bruise their udders. It may be that they are obliged to walk over walls or bars and become bruised by so doing. A great many udder troubles are caused from bruises. Colds from forcing animals to lie in damp, wet places also bring on garget.

Hardware disease—I will venture to say this is new to most cow keepers; at least they are not familiar with the term. I must confess that I never heard anyone else use it; but the hardware disease cost me more losses than any other one ailment during the fourteen years I had charge of a large herd. By this disease I mean the results which come from the animal swallowing or taking in all kinds of hardware, such as nails, wires, needles, bolts, jack knives, and railroad spikes. A great many animals which mysteriously die after a long illness, I believe die from hardware trouble. If a post-mortem were made, probably some spike or nail would be found in a vital organ. The best way to prevent this danger is to give care each day that the mangers are thoroughly cleaned out.

Calf mortality is another serious matter. Every cow should be provided with a pen at least eight to ten feet square for a lying-in stall. Both floor and bedding should be clean, dry, and even disinfected. Calves are often abused by forcing them to occupy damp and closely shut-in stalls or pens. A calf pen should be open, allowing the circulation of air and light and sunshine. Fresh water should always be at hand, and sick calves should not be allowed to occupy the same pens with well calves. In building the barn, care should be taken to provide a good place on the south side for the calves. Remember they are the baby cows, and should be so treated. A little care will often save a valuable calf, and the per cent of calf crop will largely determine your success in the breeding business.

Nebraska. A. L. HAECKER.

Feeding Sunflower Silage

HOARD'S DAIRYMAN:—We commenced feeding the sunflower silage two weeks ago. The silage was in the bottom of a 40-ft. silo and was penetrated at first somewhat with the juice of the corn silage that had been on top. The cows did not refuse to eat it, but they do not like the sunflower silage as well as the corn silage. We give them only half the amount of the latter, otherwise they would not clean it up. In order to keep the milk yield from falling off the grain ration was increased.

I shall not raise sunflowers again, in fact I am glad that my second silo is full of corn silage. Considering the enormous yield and the climatic conditions under which sunflowers can be grown, I would recommend it for stockmen that have to feed range cattle during the winter.

Miles City, Mont. W. S.

Jersey Cattle Notes

For week ending March 11:

Number of animals registered: Bulls, 269; cows, 533; total, 802. Number of transfers recorded: Bulls, 235; cows, 625; total, 860.

For every concrete job on the farm use Lehigh—the National Cement. There's a dealer near you who sells it. You'll know him by the blue and white Lehigh sign—the sign of good service and good cement. Look for it.

2 Men Milk 60 Cows Daily

with the

HINMAN MILKER

Wm. Saalbach, Mgr. of the Dairy Department of the largest farm and ranch of its kind in the United States, writes as follows: "I think the cows are in better condition than by hand milking. We are milking 60 cows with the Hinman the year 'round and 2 men are doing this work very nicely. In the spring of 1921 we shall use the Hinman Milker for official and semi-official test work."

And so it goes with the Hinman the country over. 50,000 are doing twice-daily duty, providing better and cleaner milk while saving one-third labor cost.

They are the lowest in price.

Easiest to use and clean.

Write for catalog—and with it we will include copy of "The Hinman Handshake" that gives facts you'll like to have.

"Give and It Shall Be Given Unto You"

(Continued from page 408)

Co-operative Cow Testing Association of Lee and Whiteside counties was reorganized with the writer acting as the new tester, and with Mr. Harvey E. Downing as one of the new members. This tells the secret of the story.

On the 5th day of January, 1919, about 4 o'clock in the afternoon, I drove into the yard of Mr. Downing and was cordially received by him and his wife. Before I had talked to Downing very long, I knew that he was in the dairy business because he loved cows. A little later when I walked out to the barn with "Harv", fourteen uniformly good Holstein heads each containing a pair of alert and watchful eyes turned in harmony to greet the stranger—fourteen of the best animals that I have ever seen assembled in any grade herd. The first impression I received from looking at that herd was a lasting one. Fourteen beautifully marked, uniform, straight-backed, deep-bodied, hard-working Holsteins—a sight fit for a king—with neat and comfortable, though plain and inexpensive, surroundings. On my first and subsequent visits to Downing's I always noticed that the cow barn was fairly cool, probably between 45 and 50° Fahrenheit, and that the air was fresh.

That night as I entered each member of the herd in the new herd book, Mr. Downing discussed each animal telling me how he had brought Blackie and Swiftie from Iowa; how Swiftie got her name because she moved her right hind leg very freely and forcefully and swiftly when things were not as they should be; how Speck promised to follow in the footsteps of her illustrious mother, Blackie; how much more peaceable little Snowflake was than her mother, Swiftie; and how fortunate he had been in buying Grandma and Daisy at a neighbor's sale the spring before. We talked about dairy cows long into the night before each of us had tired of listening to the other's experiences, beliefs, and practices. I went to bed feeling happy and contented, a feeling that exemplifies the life of a cow tester.

The following morning, Downing and I learned that his was a high testing herd. To make a long story short, Harv's herd finished around the top of the list with the pure-bred herds that first month, and in practically every succeeding month his herd was either at the top or else giving the leaders a close race for the honors. How did he do it? Here's where the "giving" part of the story enters. "Give and it shall be given unto you." When a little change in the herd ration was suggested, Downing tried it out. His herd rose considerably in production the first month, although it had been excellent before any changes were made. He gave his cows a balanced ration, he fed them accurately according to each individual's appetite and production. He gave them alfalfa hay, warm water in winter, good silage, plenty of clean straw bedding each night, kind treatment, and careful consideration for their comfort. When summer came and the neighbor's cows were out starving on burnt, brown pastures, Downing's cows were in the yard eating freshly cut green alfalfa out of a rack, and at milking time a little ground oats and barley. Twice a day the overflowing milk pail and the full milk cans proved the rest of the quotation, "it shall be given unto you again".

At the end of the year, Downing's herd of grade Holsteins stood at the top of the list, although one of the

original fourteen cows had been sold because she didn't quite measure up to Downing's high standards. It is interesting to note here that Blackie returned more profit over the cost of feed than any other cow in the association. Here is the average production for 1919: Number cows, 13; average milk produced, 9,542 lbs. average test, 3.7%; average amount fat produced, 351 lbs.; value milk, $313.32; value of feed, $122.31; return over feed, $192.55.

On my last trip around the route in January, 1920, I put this question to Mr. Downing: "Don't you think you would have been just as good a dairyman and would have made your herd produce just as well had you not joined the cow testing association?" Evidently Downing had thought the question through before it was asked for he came back at once with this statement: "I might have been just as good a dairyman but I never would have fed my cows quite so well; I never would have taken quite so much interest in my herd; and, moreover, there wouldn't have been so much pleasure in my work last year if my herd hadn't been tested regularly each month. That's why I signed up to have my cows tested another year."

Before I left the association, "Harv's" parting words were these: "George, I'll bet you I can make my herd average 12,000 pounds of milk and over 400 pounds of fat this year." This statement I thought an extravagant one, but time proved that it was not made in vain. That first month in 1920, Downing put eight of his best cows on three milkings a day, doing all of the feeding and milking himself besides the other farm work. The only change made in the ration was the addition of wet beet pulp fed twice a day, and a little higher protein ration made up of ground oats, corn, bran, cottonseed, and oil meal. The result was that the average production for January was well over 50 pounds of fat per cow with Daisy, Blackie, Grandma, and several of the other cows milking from 60 to 80 pounds per day and yielding an equivalent amount of fat for the month.

On the first of February, G. E. Dickson, a graduate of the University of Illinois, full of enthusiasm and sound practical knowledge, was hired as tester. The results which follow show how efficiently and effectively Mr. Downing and "Dick" worked together to reach the goal which "Harv" had set for himself:

Average Herd Production for the Years 1919 and 1920

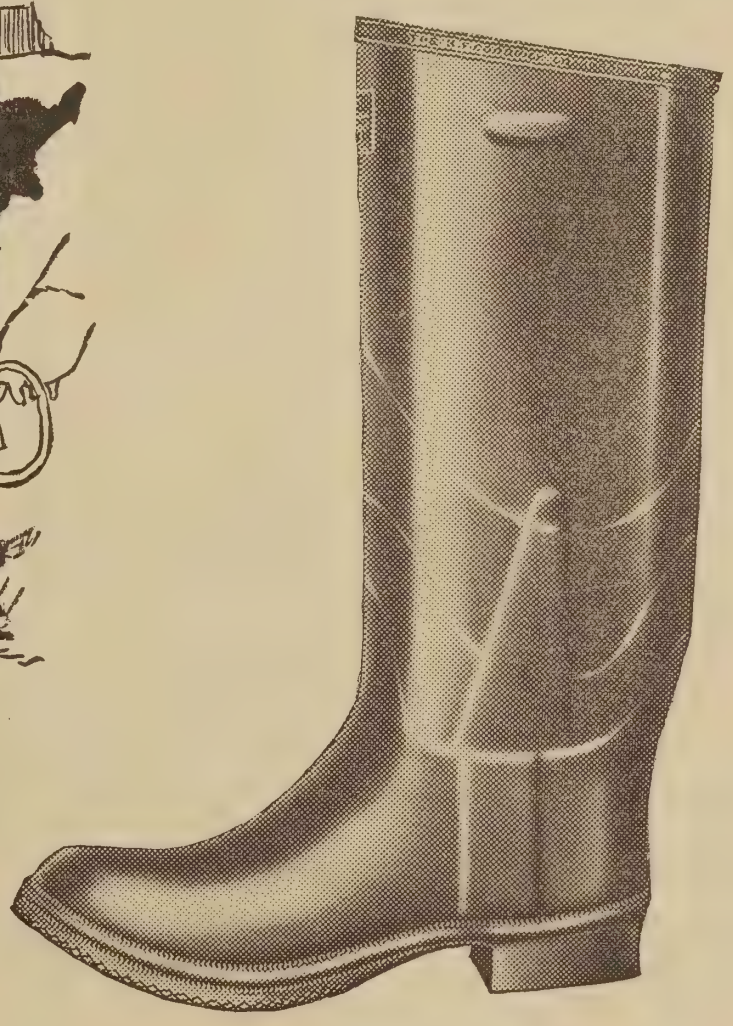
Yr.	Milk Lbs.	Test %	Fat Lbs.	Value milk	Value feed	Return above feed
1920	12,396	3.8	475.87	$400.67	$159.49	$241.32
1919	9,542	3.7	351.00	313.32	122.31	192.55
Gain	2.854		124.87	$ 87.35		$ 48.77

During the year several more members of the original herd were sold to neighbors, several of whom owe a successful beginning in the dairy business to the blood drawn from Downing's herd, and to his help and advice in purchasing the right kind of stock. Blackie died early in the year from "compaction", leaving Speck and a promising yearling heifer daughter to maintain the family reputation. Downing's record for 1920 stands high among the cow testing association records of the state. It represents a job carried to completion; it preaches the gospel of better dairying more effectively than words can preach it; and it emphasizes the point, that what we receive is usually proportionate to what we give. This is the story of Downing's record herd.

If I could change the quotation at the beginning of the story to make it apply here I would word it this way: "Give and it shall be given unto you, good measure and running over will good dairy cows fill the milk pail, if you will give them according to their needs and comfort, for with the same measure that ye mete, withal it shall be measured to you again."

"Now why this old potato taste,
And why this acrid bite?"
"'Tis partly age, but mostly this—
"You stored me in the light."

"Why do you blacken at the heart
And seem a total loss?"
"Too many spuds are piled on top
You've got me smothered, boss."



"Why do you rot within the bin
And smell so very dead?"
"You didn't spray, you didn't spray,"
The sad-eyed Murphy said.

GOODRICH
HI-PRESS
RUBBER FOOTWEAR

What makes your boots wear out, you dairymen? Is it grease from the cream or simply downright hard everyday usage? Maybe it's both—but whatever it is you won't find it "getting to" your Goodrich Boots or Shoes. Goodrich won't buckle, peel or come apart—but it will give you remarkable service just like a tire or a piece of belting or anything with *Goodrich* Rubber in it. The word means half a century of experience, and a square deal policy. Cut down your footwear bills with Goodrich. 60,000 dealers—ask *yours.*

The Satisfaction of Owning a Primrose

The man who owns a good herd of dairy cows these days knows that whatever happens in the grain market he has a safe and continuous source of income. What a feeling of satisfaction!

The same feeling of security comes to the man who owns a Primrose Cream Separator. He knows that every particle of butterfat is recovered from his milk. He knows that the cream will be delivered in perfect condition for butter making and will bring the top price. He knows that his young stock will mature in the shortest possible time because he has ample skimmilk, warm and sweet, to feed them.

He knows he has a cream separator he can depend upon; one that has long and satisfactory service built into it. He knows the wife or daughter can turn it easily and that it requires little time or effort to keep it clean; that it will require the minimum of mechanical attention.

There is no greater satisfaction than this because every other feature of his prosperity depends upon it. The Primrose assures his getting the most out of every item he sells.

The Primrose is built in four sizes:
No. 1, 350 lbs.—40.6 gal. milk per hour.
No. 2, 450 lbs.—52.3 gal. milk per hour.
No. 3, 650 lbs.—75.5 gal. milk per hour.
No. 4, 850 lbs.—98.9 gal. milk per hour.

All sizes can be equipped with electric motor drive for farm lighting system or central station current; all can be fitted with direct power drive attachment. See your nearest International dealer or write for a catalog.

DAIRY MARKET NEWS

New York Butter Market

New York City, March 15:—The market, which for some time has been cleared of Danish butter, is again flooded with that butter, and additional large quantities are expected within the next ten days. The freighter, Hellig Olaf, bearing 10,870 casks and 800 boxes of that butter docked on Saturday of last week and the butter is now available. Another boat is due at any time and carries about 6,000 casks of Danish butter. Cable reports from Copenhagen state that the Oscar II left that port on March 11 bearing approximately 19,000 casks of butter. The dumping of 4 million pounds of Danish butter on this market within a period of two weeks very naturally tends to cause dealers to be apprehensive of market conditions in the near future and is resulting in a very nervous condition. The price tendency is constantly downward and there is little hope that there will be a reaction for some time. A small quantity of Argentine butter, 3,500 boxes, was unloaded during the past week. However, that butter is of such quality that its influence is not felt.

Receipts of domestic butter are showing a moderate increase. One pleasing feature of present receipts is the improvement in quality that is apparent. Some of the lots are beginning to show grass flavor, which is evidence that in some sections herds are already being placed on pastures. Unless there should be a radical change in the weather conditions, it is expected that the make will increase very rapidly during the next two or three weeks. Because of the influx of Danish butter, the increase of domestic receipts, and the constant tendency for butter prices to decline, receivers are very anxious to keep their stocks moving. That also tends to make it a buyers' market which accelerates the downward trend to prices. There is ample reason for butter prices to be 20c lower than at this time one year ago.

Storage butter is moving very slowly and holders of it are so anxious to clear their holdings that they are offering it at very low prices. This has been an unfortunate year for speculators in butter as they purchased their stocks last June when butter prices were 52@56c. In addition to the original cost they have had to face carrying and storage charges which aggregate fully 2c per pound. At no time have they been able to get the original cost of the butter from their sales and they have been forced to sell at times at prices fully ten cents per pound lower than what the butter cost them However, the present storage condition is not bad in this market as the aggregate holdings in storage warehouses is at present only 5½ million pounds as compared to 6½ millions at this time in 1920. The aggregate holdings of butter in cold storages throughout the country is about 2¼ million pounds greater than one year ago.

Since last week Monday butter prices have declined 6½c. On that day extras were quoted at 52½@53c. On the following day there was a drop of 1½c, which was followed by successive declines of 1½c, 2c, and 1c on the three following days. On Saturday, however, there was a more active demand and there was a price recovery of ½c, but on Monday of this week, while there was no change in quotation, the market suddenly became very passive, which undoubtedly was the result of the arrival of the large shipment of Danish butter. Today, the market has been very weak and prices declined 1c. A further decline is expected tomorrow. The Danish butter is not in active demand and is being held for prices of 45½@46½c. Established quotations today are: Extras (92 score), 46¼@46½c; higher scoring than extras (93 score or higher), 47@47½c; firsts (90—91 score), 45@46c; firsts (88—89 score), 42@44c; and seconds (83—87 score), 37@41c.

There will be no cessation of shipments of Danish butter for several months. With Danish exchange low, with the duty on butter at but 2½c, and transportation charges but 1c per pound, the Danes would be poor business men to curtail their shipments of butter under conditions that prevail at present. It is possible that less butter will be received from Denmark during warm weather as there are insufficient cold storage facilities on boats plying between Denmark and this country to accommodate shipments as large as have been shipped during the present winter. The Danes realize that in case their butter arrives here in bad condition it means an injury to the good will toward their butter that has been built up during the past few months.

W. B. LIVERANCE.

Butter Prices Back to Low Point

[Report by U. S. Bureau of Markets.]

The weakness which developed on the butter markets the middle of the previous week continued into the week ending March 12. The opinion of many traders that the market would find a level around 50c for fine butter proved to be wrong, because increased buying failed to materialize and the receipts of fresh butter showed a tendency to increase and accumulate. Sentiment was more pessimistic during the week than it has been for some time, but a little better tone was noted at the close, especially in eastern markets.

Telegraphic advices from San Francisco state that the remainder of New Zealand holdings on that market are being shipped east. Offerings of fresh California have been made at relatively low prices but it is believed that in view of the condition of eastern markets, these have attracted but little buying.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending March 12, 1921, and the corresponding week last year, were as follows:

	Week ending March 12 1921	1920
	Cents	Cents
New York	49.5	66.7
Chicago	47.2	68.0
Philadelphia	50.2	67.7
Boston	49.4	67.5
San Francisco	39.7	59.5

The receipts of butter at these markets were 7,799,214 lbs. as compared with 7,543,708 lbs. last week and 7,666,686 lbs. a year ago.

Western Cheese Markets Lack Firmness

(Report by U. S. Bureau of Markets)

Cheese markets were steady to firm during the week ending March 12. The new season of production is at hand, but the immediate outlook is regarded differently by various groups of the trade. There are those who feel that prices should be lower, but on the other hand business in certain local markets has

*Hay quotations represent average of cash sales at these markets. †Nominal.

Straw—Quoted prices are: Rye straw—$19 New York, $17 Baltimore, $15 Cincinnati, $15 Pittsburgh, $14.50 Chicago, $8.50 Minneapolis; wheat straw—$14.50 Baltimore, $8 Cincinnati, $14.50 Pittsburgh, $12.50 Chicago, $8 Minneapolis, $8.50 Omaha; oat straw—$18.50 Baltimore, $8 Cincinnati, $14.50 Pittsburgh, $13.50 Chicago, $8.50 Minneapolis, $9.50 Omaha.

ever warranted slight advances on an occasional style.

The New York market continues to show a more or less firm feeling. Competition from other markets, notably those in the West and South, as well as a lower production, has resulted in light receipts of New York cheese, for which there is a heavy local demand, and has caused prices to advance ½ to 1c on the larger styles. Export business is certainly lending no support. There has been some movement to Canada in odd lots of old cheese, some being sold as low as 5 to 12c per pound.

At Chicago the apparent firmness of Wisconsin primary markets was accepted with more or less doubt, and buyers failed to show even ordinary interest in offerings. Continued dullness in trading and a feeling that country markets would soon be lower caused some weakness, and concessions in price toward the close of the week were general enough to reduce quotations on Twins ½c.

Sales at Wisconsin primary markets during the week were mostly small lots. The general tendency of buyers was to take on no more stock than could be disposed of readily. Receipts at warehouses are said to be increasing rapidly, partly because many factories which have been making Brick cheese are now changing over to the American type. The market on Brick cheese is responsible for this, as fancy Brick has been worth less than 20c at factories.

The average wholesale prices on American cheese (style Twins) for the week ending March 12, 1921, and for the corresponding week a year ago, were as follows::

	Week ending March 12	
	1921	1920
	Cents	Cents
New York	27.7	29.5
Chicago	26.9	28.4
Boston	25.0	31.5
San Francisco	20.7	30.5
Wisconsin	26.9	28.9

The total receipts of American cheese at these markets were 2,960,551 lbs. as compared with 2,748,757 lbs. a week ago and 3,055,056 lbs. a year ago.

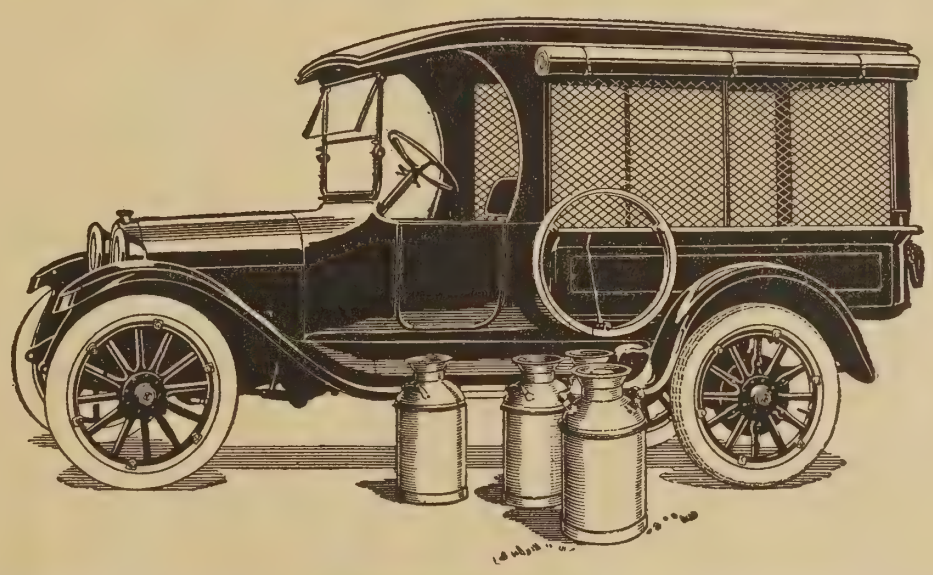
Ohio Holstein Association Increases Membership

On March 11, the Ohio Holstein Breeders' Association completed its series of meetings in a most successful membership campaign. Some work will yet be done by breeders in their own communities in bringing into the association the Ohio owners of Holsteins not reached in the 130 meetings scheduled but the returns now in put the organization in splendid shape.

The campaign, put on under the direction of Secretary H. C. Barker, gives a three-year membership by which annual dues are collected through the members' banks. The annual fee is one dollar for purebreds and twenty-five cents for grades. This basis is fair to large and small breeders alike, since the fee is proportioned to the number of cattle, just as are the benefits from the organization. Twenty per cent of the dues are returned to the county associations.

In the meetings over the state, effort was made to bring breeders in closer association in each community and to emphasize the benefits open to all through the state organization. Besides the strong membership which was built up, a great deal was done toward developing a state-pride in Ohio Holsteins which will foster the keeping of better bred animals and giving them improved feeding and management.

DODGE BROTHERS
BUSINESS CAR



It is the hauling mainstay of most of the farmers who employ it

It saves them money, because of the outstanding economy made possible by the strength and soundness of its construction

It saves them time and labor for the same reasons; and it serves satisfactorily from year's end to year's end

The haulage cost is unusually low

DODGE BROTHERS, DETROIT

GEHL

An Ensilage Cutter that is remarkable for its fine clean cutting capacity, durability, safety and light power requirements.

Give us the height of your silo, size of engine and size and speed of pulley and we'll forward complete information about the right size of Gehl Cutters.

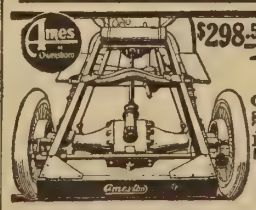
Any 8-16 Tractor Runs a Gehl 17

Due to its separate control of cutter head and blower speeds the Gehl Cutter never wastes power on any silo—has six fan low speed blower, heavy all steel frame, positive safety device, and a self feeder that

2-21

Requires No Man at the Feed Table

Here is an example of economy—a machine that not only fills your silo, but can also grind alfalfa hay—dry corn stalks, soy beans, sweet clover or any other form of dry roughage. This means a saving of from 20 per cent to 50 per cent.



Our new catalog gives complete information about Gehl Cutters and some useful ideas about conserving and getting more profits out of dry feeds. Write today.

BANK YOUR CORN

In These Better Cribs

Here is a view of the famous Buckeye steel rib framework. Note the heavy vertical steel ribs--the supporting steel circle at top and bottom. Consider what a backbone of rugged strength this adds.

Note the perforation. It is made to shed the water away from the opening. The metal is pushed away from the opening far enough to give the full area of the perforation. You get 25 per cent more ventilation in the Buckeye than in any other crib on the market.

THE moment you shovel your corn into a BUCKEYE you have deposited your crop in a place as safe as any bank--a storage house that is ***weather-proof and pest-proof.***

And you are drawing interest on it all the while. For your corn comes out of the BUCKEYE sound, dry, thoroughly cured -- worth a great deal more than when you put it in the crib.

One reasen for the wonderful success of the BUCKEYE is its perfect ventilating system. You get ***25% more ventilation*** than in any other crib. Add to this the strength and rigidity of the famous steel rib construction -- and you have a fair idea of this better metal crib.

There's not an investment that would return you bigger profits than the purchase of a BUCKEYE corn crib or grain bin. It will last a lifetime. Easy to erect. A screw-driver and wrench are all the tools you need. All sizes and styles--round, oblong and double-shed types. Your dealer will give you the complete facts on BUCKEYE. Or write us direct.

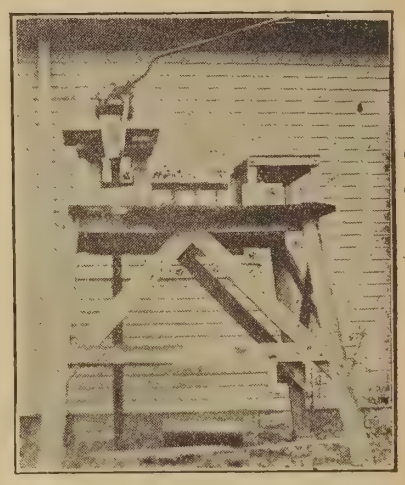
WRITE FOR CATALOG TELLS ABOUT WONDERFUL DOUBLE FEED

Double Returns from Farm Manure

(Continued from page 409)

to do the distributing. What I mean is that since it is best to get farm manure on the land as soon as possible, a greater use of the pasturing system than is common should be made. In the case of hogs, for instance, the manure from these animals is the richest in plant food of that from all classes of live stock. Hog manure contains a comparatively large amount of the much needed phosphoric acid in addition to some ammonia and potash. Yet on most farms little if any of its value ever reaches the fields from which the crops fed came. I have a neighbor farmer who has had the same hog lot for at least ten years and why? Simply because his present yard is handy and he has failed to invest in enough more hog proof fencing to give the animals a wider range. For years this man has not only poured valuable fertility into his hog lot through the crops fed but at the same time he has lost an opportunity to make cheaper pork in an easier way.



Investigations have shown time and again that one of the most economical ways of making gains is to permit pigs to "hog down" corn. The time available for this manner of feeding ranges from a month in the North to two or more months of each year in the southern part of the corn belt. No elaborate equipment is necessary; just enough woven wire tied to the standing corn stalks to block off successive parts of the field is all that is needed. All the labor of cutting, shocking, snapping, and carrying the corn to the hogs is eliminated—the animals wait on themselves. The feeding can be concentrated on the thinnest parts of the field for reasons which are self evident. Feeding in this manner eliminates entirely the necessity of handling the manure, but better than this the entire fertilizer value of the material is utilized.

A wider employment of sheep, steers, and dairy cattle to pasture down crops should likewise be made for the same reasons. One need only visit the farms of Henry E. Krueger, world's champion grain grower, Wisconsin, to see the benefits from this practice. Mr. Krueger has pastured as many as thirty-five head of dairy cattle for three weeks on fifteen acres of sweet clover sown in corn at the last cultivation. The manure of the animals that graze in this manner plays no small part in making record yields of grain the following years. Where facilities are not at hand for a wide use of the pasturage system of manure distribution, the least one can do is to provide a concrete, brick, or other water tight feeding floor from which a large part of the manure can be collected and hauled to the fields.

It is the nature of every one to do things in the easiest way. That is why fields near the barnyard ordinarily get manured more frequently than those forty rods away. A good way to keep the fringe of the farm in good tilth is to have the pastures on the borders of the farmstead. It is about as easy to go forty rods to get the cows as it is to travel half that distance. In other words, the simplest way to manure this land is to use it for grazing purposes as much as is practical.

Spread the Right Time and Way

About the only drawback to the practice of pasturing down crops and fertilizing soil by this means is that the system cannot be made use of all through the year. Under any system of farming, therefore, a large part of the manure invariably accumulates at times in the barn or barnyard around the strawstack. It pays to store this fertility in a water tight pit. Such a solid floor not only prevents a sloppy barnyard but makes loading of the manure much less of a task. In a permanent system of agriculture straw as a feed and manure beats cash in hand for the product. If the straw piles are still sizeable when the time comes to make new ones, every ton should be hauled to the field. An inexpensive spreader will facilitate making every pound of the material benefit the land. Weight for weight, straw is equal to farm manure in crop producing value. It is excellent as a protection for winter grains in addition to the plant food it supplies. One of the most famed potato growers of the country, Mr. C. G. Kuney, Wisconsin, who produced 12,000 bushels of Ro-

Utilization of liquid manure is simplified by a handy pumping device to load it into the distributing cart.

sen rye on 300 acres last year will return every straw that produced a head back to the land.

Now, although it has probably never before been called to the attention of farmers in this way, I project the hardly disputable statement that the time is at hand when it is just as important that every one should know just what application of manure will give best results on the different fields of the farm he works as it is to figure out a balanced ration for dairy cows. What is the economy of calculating how to save ten per cent on the daily feed bill if at the same time fifty per cent of the fertilizing value of the manure of the animals is being lost? If one goes to the trouble to have his land tested for its need of lime, isn't it just as reasonable that he should determine how many tons of the more costly farm manure he can afford to spread per acre in order to reap the biggest net return? All of the manure on the farm must of course be used.

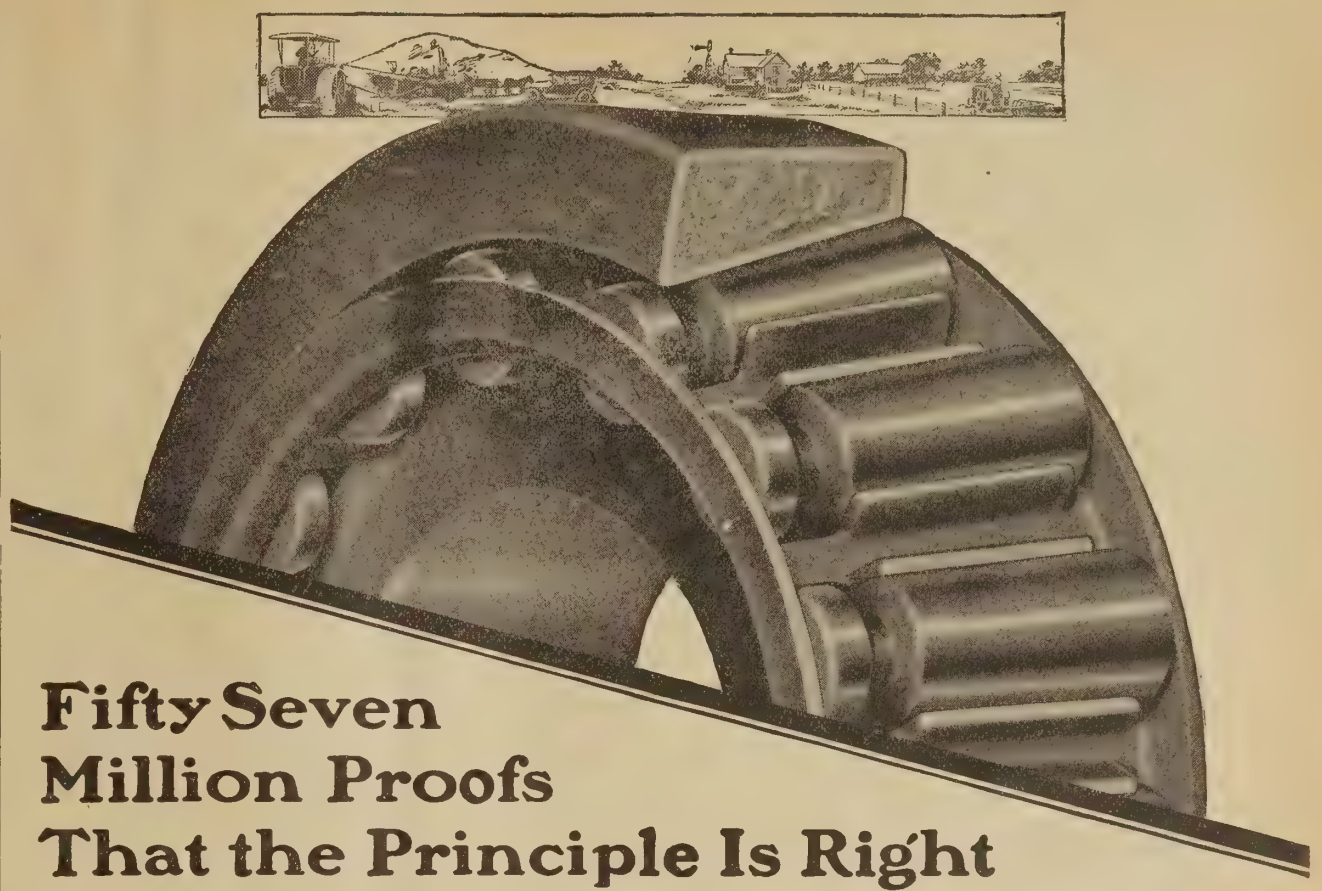
The big thing each man should work out and can work out is how can the available supply be most effectively used. The question naturally arises—How can this be determined? Fortunately much of the experimenting a farmer might have to do has already been done for him by others. Tests made at the Pennsylvania Agricultural Experiment Station and by many farmers have shown beyond a doubt that where an abundance of farm manure is available, maximum acre returns on most soils will be obtained when the material is applied as heavily as 16 tons to the acre in the case of the staple field crops. With potatoes and truck crops, even larger dressings pay best.

However, except in the case of a few dairy farms, there is seldom more manure produced in a year than sufficient to fertilize the cultivated land

with more than one or two tons to the acre. In other words, the big majority of farmers haven't near enough barnyard manure to go around. Under these circumstances, the investigations mentioned above show that the return per ton is from one-fourth to one-third greater when eight tons as compared with double the amount are applied once in four years. Stating the matter perhaps more clearly, a light dressing over several acres is better than a heavy application over a smaller one. Bringing this home to one's own specific case these mean that greatest profit from farm manure will undoubtedly be obtained when less than eight tons to the acre is spread over the farm during each round of the rotation. Whether less than eight loads to the acre over a larger number of acres would give even more profitable returns it is up to the individual to find out.

Experience has shown that manure and fertilizer give far greater returns when applied to the thinnest lands than is the case when spread on more fertile fields. It should also be more generally understood that various crops differ widely in their response to manuring. Again, the employment of a manure spreader is a material aid in making manure available to more acres. It is an absolute fact that eight loads will go as far as twelve if, rather than apply the material by hand, a spreader is used. The manure spreader aids in making the plant food of the fertilizer quickly available by pulverizing and more evenly distributing it. Hence the purchase of such an implement not only increases the returns by reducing the labor cost of application but it gives the fertilizer a chance to yield at least a third more in the crop increase that it makes.

Crops to Manure



Most farmers manure grass land which is to be plowed for corn. This is a good place to distribute manure, but worse than no returns are frequently secured when the land is spring plowed. This is for the reason that such heavy manuring starts the crop out with rapid growth but as the season advances and the land dries out, the vegetable matter wadded up under the furrows stops the rise of moisture from the subsoil, with the result that the corn often receives a setback, from which it does not fully recover. By discing the manure into the land, and plowing it under in the fall, nothing but benefit from the application will result. Manure always gives good returns when applied prior to the planting of cultivated crops such as corn or potatoes.

Where the better plan of dressing the land twice rather than one heavy application is made in the rotation, part of the manure can best be distributed on winter grains which are seeded down to clover and grass. At the Pennsylvania Agricultural Experiment Station, six tons of farm manure per acre used in this way gave one dollar more return per ton than ten tons applied to equally fertile land. When winter grains are top-dressed with either straw or manure, not only will a handsome increase in the nurse crop result, but the new seeding which is the backbone to every farm rotation will get a good start. The manure can be applied either before or after the ground is frozen. Early fall top-dressing is preferable in that the plants can make use of a part of the fertilizer to make a vigorous growth before winter. This assists them in withstanding the cold weather which follows. However, from the standpoint of ultimate utilization of the plant food in the fertilizer during the rotation, it is just as advantageous to spread the material in winter or early spring. In either case, the dressings delay premature thawing of the ground in the early spring and thus heaving out of the plants is minimized.

In the face of a general shortage of home grown fertilizer on the average farm, it is good business to put in practice the slogan, "Use fertilizer to grow more crops to feed more stock to make more manure". This idea has been projected by the Soil Improvement Committee of the National Fertilizer Association and it represents a sound basis for a permanent system of land enrichment. For example, at the Ohio Agricultural Experiment Station, where 320 lbs. of phosphate fertilizer was applied to land with eight loads of manure to the acre, once in a four-year rotation of corn, oats, wheat, and clover, the returns were in favor of the system. The year following the treat-

TIMKENS MEAN - MORE and BETTER FARMING - BY POWER

Fifty Seven Million Proofs That the Principle Is Right

Since that day more than twenty years ago when a Timken Tapered Roller Bearing was first installed in a motor vehicle, the principle of Timken Taper has remained unchanged.

Yet during those years, American and European manufacturers have used more than fifty-seven million Timkens. And, as far as we know, not one of those fifty-seven million Timken Tapered Roller Bearings has ever been replaced by any other bearing.

Fifty Seven million Timken Bearings! Twenty years of service! Not a single Timken that we know of replaced by any other make! Hardly a tractor, truck, or automobile in America today that does not boast of its Timkens!

Could one ask for more convincing evidence of the correctness of the principle, design, and construction of Timken Tapered Roller Bearings?

Because of their superior ability to carry *all* loads no matter from what angle they are applied–

because they carry those loads with *negligible friction loss*—

and because, when the inevitable wear that *must* follow motion does come, a simple adjustment or take-up easily and quickly made, makes them function as if they were new, Timken Tapered Roller Bearings increase efficiency and reduce upkeep whenever and wherever they are used.

Thus do they play their vital part in the development of More and Better Farming by Power.

The Timken Roller Bearing Co, Canton, Ohio

Arcady Farms

A practical test farm that pays good profits

Near Lake Forest, Illinois, is located our Arcady Farm, operated by a practical dairy farmer on a strictly business basis.

On Arcady Farm are 100 head of grade Guernsey and Holstein cows, producing from 30 to 35 pounds of milk daily per cow—over 1000 quarts of certified milk are shipped to Chicago daily.

Arcady Farm has raised as high as 103 bushels of oats and 60 bushels of barley to the acre, yet every pound of this grain was sold. Arcady Feeds were bought and used at a profit in place of the home grown grains.

This profitable farm tests and uses every Arcady Feed—if any other feed had proven better, it would now be in use.

You will find Arcady Scratch and Egg Mash Feeds equally productive. Write NOW for full information and name of local dealer.

Weyman-Bruton Company, 1107 Broadway, New York City

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, March 14—Representatives here of the dairy interests are awaiting news of the action of the Internal Revenue Commissioner on the adulterated butter ruling, with interest and impatience. No appointment of a new commissioner to succeed W. M. Williams has been announced although there are strong rumors that former Governor White of West Virginia is to be named. In some quarters it is now believed that the present commissioner, if he continues to hold the office, will retain the antagonistic attitude he has assumed from the first, and not take any steps to either clearly define or modify his ruling. This will force the creameries affected to either await action by the internal revenue agents and stand a test case involving seizure and arrest, or else move in a legal way to prevent action by internal revenue agents. This can be done by an injunction proceeding. There appears to be another way out of the dilemma, inasmuch as there are now new heads of both Treasury and Attorney General's offices, and that is by presenting a fair statement of the matter to Secretary Mellon of the Treasury Department, and inducing him to propound a new set of questions to the new attorney general or in some other way seek a new and enlarged opinion from the head of the legal branch of the government.

⚜

James M. Oyster was nominated and confirmed as a Commissioner of the District of Columbia. Mr. Oyster is the largest milk dealer in the city of Washington, and bears a high reputation as a business man, financier, and public spirited citizen.

⚜

Information is now at hand confirming and filling in the details of the brief telegram sent last week to Hoard's Dairyman telling of the dismissal of the indictments against the officers of the Louisiana Dairymen's Co-operative Association. The indictment was brought by a Federal Grand Jury against the secretary and two directors of the association for violation of the anti-trust laws in increasing the price of milk in New Orleans. So far as known it is the first case ever brought against a farmers' co-operative association, organized on a non-stock, non-profit basis. The demurrer was filed in the most general terms raising the issue that under the provisions of Section 6 of the Clayton amendment, the officers of the Louisiana association were fully protected and did not violate any law. The demurrer was argued in open court, and there decided from the bench, so no written opinion is available. The Federal District Judge for the New Orleans district held specifically that Section 6 of the Clayton amendment covered the case, and that no law had been violated by the defendants.

⚜

Evidences here point to an early meeting of the preliminary committee named at the Dairy Show, to begin work on the World Dairy Congress, authorized by Act of Congress, passed and signed March 3. Professor Van Norman is the man most considered for the permanent chairmanship of the organization which will be necessary, provided of course that he can accept and give the necessary time, and proves satisfactory to the bigger commercial interests whose co-operation is required for the full success of this great enterprise.

⚜

Milk campaigns, in which the experts of the Dairy Division are co-operating, are now in progress in Michigan and South Carolina, with the Iowa campaign just closed, and one almost ready to begin in Ohio. Miss Jessie Hoover, department specialist in milk campaign work, is at Greenville and Columbia, South Carolina, and the campaign there is reported as very successful. Her assistant, Miss Louise G. Hoolbrook, has just finished her work in Iowa, and will be in the campaign work in Michigan the coming fortnight or longer. Both are expected to take part in the Ohio campaigns which are being planned on an extensive scale. These campaigns are worked out in great detail, with producers, distributors, consumers, state and local health officers, and state and federal dairy officials working in co-operation, using schools, community organizations, and newspapers in the campaigns.

⚜

The Washington officer of the National Dairy Union reports work at present compiling the statistics of the dairy industry in the states. From Alabama, for example, the figures show that the dairy industry in that state in 1920 produced more money than the cotton industry. Favorable reports come from Tennessee and North Carolina, and only one state at this time reports pessimistic dairy prospects. That state is Georgia. The complete report will be compiled as soon as the final census figures are available.

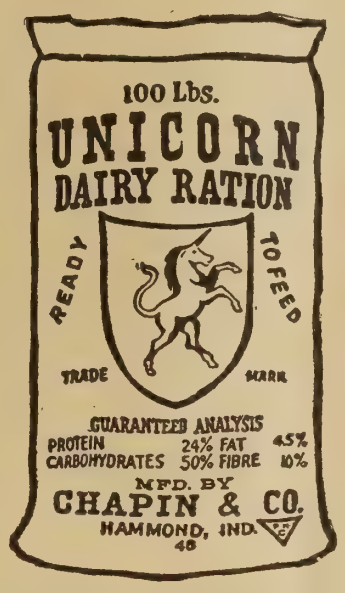
Larson Appointed Chief of Dairy Division

HOARD'S DAIRYMAN:—Carl William Larson has been appointed chief of the Dairy Division, United States Department of Agriculture, succeeding B. H. Rawl, whose undivided effort in future will be pledged in the performance of duties connected with the office of Assistant Chief of the Bureau of Animal Industry. The confirmation of the change is of recent record, the promotions being a recognition of experience and valuable service rendered in previous capacities.

Doctor Larson, recruited from an assistant professorship of agriculture and agricultural economics in Columbia University in May, 1917, when the world conflict emphasized the urgency for a multiplied output of dairy products, applied himself diligently to the pressing tasks. The effectiveness of his activities in a war-torn period, supported by an intensive and continuous previous contact with dairying and dairy management, placed him in good standing with the Dairy Division. He assumes his new position with a grasp of dairy problems as well as having earned the reputation of being a man of excellent business qualifications.

Doctor Larson is a native of Iowa. His early boyhood years from the time he was twelve years old until he matriculated in college, were spent on a farm in the neighborhood of St. Ansgar. His vacations, outside of academic walls, were likewise identified with life of the countryside. He was graduated from Iowa State College in 1906, receiving the degree of bachelor of science. Degrees of M. S. from the Pennsylvania State College in 1913 and Ph. D. from Columbia University in 1916, suggest his accomplishments in pursuit of a collegiate training. His major studies at these institutions consisted of animal husbandry, dairying, and general economics.



Once beyond the campus of a more or less theoretical educational horizon, he lent his efforts to practical service. For twelve months he identified himself with commercial dairy manufacturing establishments. His succeeding opportunity for service involved duties as an instructor in dairying in the Pennsylvania State College, his affiliation with this institution continuing for an unbroken period of five years. He was head of the dairy department and had active management of the college herd and creamery. These responsibilities were discharged with credit. After being awarded the degree of doctor of philosophy at Columbia University he was assigned the chair of assistant professor of agriculture and agricultural economics in that institution. He occupied this position until coming to Washnington in May, 1917. Dr. Larson is a tireless worker, and whether the immediate problem of the Dairy Division is that of stimulating milk campaigns in cities or that of the formation of a cooperative bull association, his mind works with systematic precision in attacking the varying tasks pressing for solution.

Washington, D. C. S. R. WINTERS.

Wisconsin Bang Farm

The Commissioner of Agriculture calls attention to the fact that neither he nor any of the employees of the department are interested financially, officially, or otherwise in the establishment of a corporation promoted for the purpose of establishing a so-called "Bang Farm", the purpose of which is to raise calves from tuberculous cattle; and if any representation is made to the effect that they are so connected it is made without authority.—Wis. Department of Agriculture.

Inferior Rations Don't Pay

Unicorn can be fed alone if your roughage is deficient in protein.

If you feed home-grown grains with Unicorn, then alfalfa or clover should make up a good part of the roughage.

Many dairymen have been feeding inferior, lower-priced rations instead of Unicorn.

The few dollars saved in price were lost either by lowered milk production or increased use of feed.

Today the price of Unicorn is so low that there is no good reason for the use of an inferior, unprofitable ration.

Start a few cows on Unicorn. Compare their milk and feed records for a month with those of the previous month.

Then you will know that for thirteen years we have been telling you the truth:

"Good cows, fed Unicorn, always make a profit."

CHAPIN & COMPANY

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

The Making of Bruce Carter

The Carters lived on a large dairy farm. So did the Hornes and Webbs. There was Ellsworth Carter, the father; Marie Taylor Carter, the mother; and Bruce Carter, the only son and heir to the rapidly accumulating estate. Ellsworth Carter was a shrewd type of Yankee farmer and well did he merit the reputation he had of being the best bargain driver of the township in which his farm was located. To deal with him meant that the party of the second part was beaten before the deal was closed, and a favorite expression of those who held down the dry goods box bleachers of the two village stores was: "Look out for Ells, he'll git all you've got and your hide besides." But Ellsworth Carter was not a dishonest man. He made his opportunities and then took advantage of them. In fact he was a born leader, and, in spite of the reputation he had, his friends were many. If there was any one fault that he had for which he might have been blamed it was the one with which many fathers could be charged. Ellsworth was such a busy man that he had little time to devote to the bringing up of his son. But as is usually the rule in such instances, Bruce had about all that a boy of his age could wish for. There was one thing, however, that every boy longs for, but which few have, that Bruce longed for; and that was ownership with the responsibility that goes with it. Of course he had a pony, as you might expect, but beyond riding it, there was little satisfaction in that, for his mother had long since ruled that Bruce was destined to become what she deemed a cultured gentleman, whatever that is. And so it was that Bruce was never allowed to care for Rex himself, in fact it was almost his mother's daily warning to keep away from the barns. That was the place for hired men and not for her cultured gentleman.

And Marie Taylor Carter should not be blamed for her foolish notions. It was perfectly natural that she should have them. Neither did she fit into the community life in which she had been living for the past fourteen years. And this was quite to be expected, too. Born in a wealthy, aristocratic, Kentucky family, Marie Taylor was raised to womanhood with but one idea ever before her and that was that a woman's main function in life is just to look her prettiest and that was the one accomplishment in which she excelled. In fact, the first attempt at real work came to her when she became the wife of Ellsworth Carter. It was then that she found herself the mistress of a home in which she was not to be surrounded by servants and body guards. Ellsworth Carter was too close a bargain driver to even have one servant about the house. And little sympathy did her complaints bring among the gossips of the neighborhood, their one comment being, "Well, she knew what Ellsworth was before she married him."

Bruce came during the second year of their married life and with it came a change which Ellsworth had longed for from the beginning of their matrimonial partnership. No longer did she seem to be the discontented, unhappy wife he had known for a year and a half, for the birth of Bruce had brought with it the finest of all woman qualities, that of motherhood. The hated and but half learned duties of the house developed a new life within, but the false ideals of her girlhood still remained with her and so it was that as Bruce grew from infancy into the realms of boyhood, he found himself living under the unnatural restraint of an altogether too fond mother.

But fortunate for Bruce, he was a regular boy. That quality he inherited from his father and no foolish ideals of an indulgent mother could destroy his masculine instinct for the pranks of the American boy. The trouble was that his mother just didn't understand boys and so it was that instead of developing into the kind of boy his mother was striving to have him be, Bruce was daily becoming more rebellious until finally it became no uncommon occurrence for his father to be called in to settle disputes which had risen between his mother and himself. And, of course, as is usually the case with boys, Bruce was convicted before he was tried. It was on such occasions that it would have been better if he had been born a girl, and more than once had he given utterance to that expression as he wept himself to sleep after being chastised by his father for boyish misdemeanors that no wise father chastises for. But with a wife and a son to please, Ellsworth Carter found life easier for himself to take the part of the former, and so it was that Bruce found life becoming almost unbearable. He wouldn't learn to be a musician nor would he stay dressed up. He was going to be like other boys of the neighborhood. He made up his mind to do as only a boy of fourteen can. He would do the thing he most desired and then take the consequences. Already he had several times been called Sis Carter by the other boys, to be sure not for any feminine qualities that he possessed, but because he was not permitted to mingle freely with them. And so, in spite of all parental restraint, Bruce would get into all of the scrapes that the other boys got into. He had his battles royal with them, and more than once would he return home with a disfigured face, for he usually got the worst of it. In watermelon and apple cooning parties, he always did his share of the damage, but it was fun and that he would have.

But Bruce was not a bad boy. You and I who know boys would just say that he was a real live wire and let it go at that knowing that he would turn out all right in the final as all such boys do. He was a boy good to look at. That he inherited from his mother. With a shock of black, curly hair crowning his well shaped head, and with eyes equally dark that looked you through, he was a type that would win in the long run as he grew into manhood. But what did he care for good looks. That is the least among the worries of fourteen-year-old boys. The freedom of boyhood was what he desired and only those who understand the savage in a boy know what that means.

Bruce wanted to be like Bill Horne and Jimmy Webb. That was the height of his ambition. Bill and Jimmy were members of good, respectable families and it was to the credit of the elder Hornes and Webbs that there were other little Hornes and Webbs to be fed and clothed and so Bill and Jimmy grew up under the natural influences of families that had other cares than those of pampering an only child. Of course Bill was William and Jimmy, James as far as the Bible birth records said, and likewise were they in the one-roomed school which they attended. But to the boys they were Bill and Jimmy, and Bruce was Boo. And we have yet to understand why the Williams and Jameses all over this land are not Bills and Jimmies inside the school room as well as out. Why should the class room not be real in its relations with the boys! That we'll leave for you to settle. Boys have pondered over it ever since schools have been, but still Bill is William and Jimmy is James. Change it and with it will come so much of what we want, but that which we cannot seem to get within the four walls of the school room. Leave it to the boys and it will be settled over night.

Bruce had developed a fondness for Bill and Jimmy that they reciprocated. This, to be sure, did not please Mrs. Carter, who regarded all the boys of the neighborhood as inferior to her Bruce and unfit for him to associate with. She abhorred nicknames and when at last she heard her own dear Bruce being called Boo, she gave voice to her sentiments upon that subject.

"I won't have you spoiled by those two little rowdies," she wrathfully announced to Bruce on one occasion. "It's bad enough to have to bear with your associating with them."

"What do I care what they call me, mother," he blithely answered. "I'm not so sure that Boo isn't better than Bruce anyway. It's shorter and it sounds lots more friendly."

"Just it," she answered irritably. "It's altogether too friendly and I want you to speak of them by their real names or I'll put a stop to your running around with them."

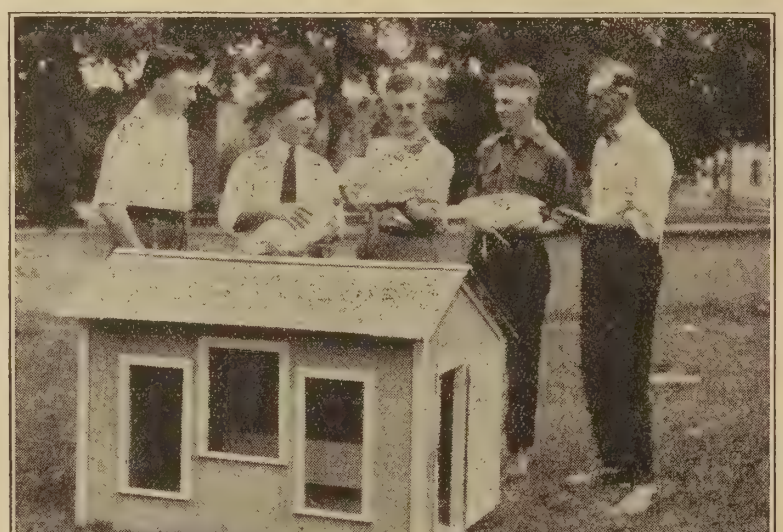
"Won't make any difference, ma," he answered serenely. "They'll be Bill and Jimmy just the same to me. That's the way I'll think about them and so why shouldn't I call them that way! Think of calling that pug faced Bill, William," he laughed, "and it would spoil all the fun of being with Jimmy not to call him that. Mother, they are just the realest kids you ever saw, and I don't see why you don't like them. I'm just crazy over both of them, especially Jimmy. He's a regular guy and, believe me, he's good, too. Nothing bad about either one of them two," he persuaded. "They're just the commonest kind of fellows, not stuck up at all."

"That's just it, Bruce, they're too common for you to be with. I want you to grow up to be a fine gentleman and that's something neither of them will be," and she was almost at the point of bursting into tears as she spoke.

"Well, they'll both be fine men just the same, mother, you wait and see and I think fine men that are real men, are better than gentlemen that ain't," he explained in boyish ignorance, and at that, out he dashed as he heard "Boo! Boo!" called from the road, leaving his mother in nervous anxiety for the fate of her only child.

"Say, Boo, Bill and I have thought up some fun for all of us and we want you in on it," said Jimmy, his big, blue-grey eyes dancing with enthusiasm. "Will you come in?"

"How do I know, you poor fish," he answered. "You haven't told me what it is and, besides, I suppose I'll have to ask mother first. Sure I'll come in if it isn't anything bad," he winked at Bill. "Go ahead and tell me about it."



"All right, then," Jimmy answered, as the three dropped into comfortable positions on the ground. "You listen and I'll explain."

"Yes, you listen," laughed Bill, "and don't you do any talking; Jimmy wants to do all of that."

"You do it, then," retorted Jimmy, "if you think you can explain it better than I can."

"Ah, go on, Jim," persuaded Bruce, "don't pay any attention to that big stiff. He's jealous, that's all."

"Well, how would you like to go in the chicken business with Bill and me?" he began. "We'll form a company, a kind of closed corporation, you know, and we'll go at it in a scientific way. You see, the three of

IT WAS AT A MEETING OF THE STATE FAMOUS MOR-EGGS POULTRY CLUB THAT JIMMY AND BILL RECEIVED THEIR INSPIRATION
(Courtesy U. S. Dept. of Agr.)

us will own all of the stock so we can collect all of the dividends," he laughed, "when they begin to come in. Now, of course, if we are going to work as a company is organized, we'll have to have a business plant, a kind of factory where our product will be turned out. Bill and I figured out that we could start in this business with the least expense that we could start anything with, so that is why we have decided to do it."

"Yes, but it will cost something to get started," interrupted Bruce, "and if I ask mother for money to go in on a thing of this kind to get myself all dirtied up every day working on it, she'll give me the dickens and that is as far as I'll get into the game, I'm afraid. "Gee! But wouldn't that be great, fellows, to do something like that, a job where we can really be our own bosses and be responsible for the success of the thing, but I'm awfully afraid to ask mother."

"Ah shucks, Bruce," broke in Bill, "have a little backbone and come in. Don't ask her. Go to your dad, he's been a boy once. He knows what kids like us want to do."

"That's just the trouble, Bill," Bruce answered. "I've got too much backbone and independence to suit mother, and what I really want to do, she never has any time for. But believe me, Jimmy, I'm coming in on this if it costs me a thousand lickings like the last one she made dad give me for helping you two in that dog scrape we got into."

"At-a-boy, Boo," shouted Jimmy. "That's the way to talk. And the licking you got for that dog scrape was worth taking for all the fun we had that time. Wasn't old Bill Smith sore though when he saw that yellow pup of his beating it across lots with that can tied to his tail! It's a wonder we didn't catch it that time, Bill, but dad just sort a smiled when he heard about it from old Bill himself, and then he told Bill to go home and forget it and to think back to the time when he was a boy. That's as near as my licking went," he laughed. "Now let's get back to the business end of this deal," he suggested. "We have an old incubator up in our attic, Boo, that we never use any more. It's old, but it's not worn out. I guess the only reason dad is not using it is because it is not large enough. Now that can be the beginnings of our plant and it won't cost us a single cent. I'll donate that to the firm without expecting any favors in return. It will hold about 120 eggs at a time. That will be our first cost, or at least it should be, but Bill and I figured that expense is entirely unnecessary. We'll each furnish 40 eggs apiece. We'll just save them out, a few at a time, so that they won't be missed, when we gather the eggs each day. And we can do that, too, very well because it happens that we are all keeping the same kind of chickens. They all started from your dad's flock of White Leghorns. So, you see, we can get a uniform lot in that way to start with."

"But I don't gather the eggs," said Bruce, disappointedly. "The hired man has to do that and all the other things that I should be doing."

"Brace up, old kid," Bill jollied him, "and let the hired man in on it. He'll swipe a few for you each day, don't you forget that. He's strong for you and you can bet your last dollar he'll do that much." "What do you say?" came from him and Jimmy in the same breath?

"Why, I've already told you what I would do," he answered. "I am in on it to the finish. I was born a boy and a boy I'm going to be," he added with a vengeance, his black eyes snapping with the fire of triumphant determination.

"All right, then," Jimmy proceeded, "we'll take up the next proposition, now that the firm is organized, or at least agreed to do so. What shall the name of the new firm be?" he inquired of his two ardent listeners.

"Well, since you are furnishing the incubator, I think that Bill and I will agree to having your name appear first in the title," Bruce suggested. "And since Bill was in on the original idea, I would suggest that his name appear second. And as for myself, I am so glad that you are letting me in on the scheme, that I will be satisfied if the firm name is Webb, Horne, & Company. How does that strike you, fellows?"

"Not at all," came in the same breath from both of them. "We want your name along with ours and it is only right to have it there if we are all sharing profits and losses equally," answered Bill. "So, if it's agreeable, I'll make a motion that the name of the company which we are about to organize be Webb, Horne, and Carter Company," he concluded.

"I'll second that motion," quickly interposed Jimmy before Bruce could offer further objections. Following this, he quickly put the motion to a vote and it was decided favorably by a vote of two to one.

"Well, I think it would have been better to have followed my suggestion," said Bruce, "then I could have kept it a secret. Mother and dad would never suspect who the company part of the title stood for. Now I'll have to make a clean breast of it to them."

"That's the way to do, old kid," laughed Jimmy. "It will win for you in the end. And now I am going to suggest that we start saving the eggs today and by the end of the week we should be ready to start on our new enterprise. Bill and I will see to it that the incubator is repaired if any is needed to put it into shape and we will guarantee to have it all regulated and ready by Friday. This is Monday, so that should give us time enough."

"But we'll need a brooder and a coop to put the chicks in when they are hatched," suggested Bill.

"Sure we will," Bruce reiterated.

"Oh, that needn't worry us; we'll have plenty of time to get that ready while the eggs are hatching," Jimmy replied.

Just then Bruce's mother appeared in the doorway, beckoning for him to return to the house. Bruce reluctantly obeyed and his two friends turned to go, but not without Jimmy saying, "Remember, Boo, what we said. Don't keep anything back."

Much to Bruce's surprise he was greeted with what he considered good news, for his mother told him that they would call to spend the evening at the Webb home, not that she cared to, but because her husband had suggested that they do so. "And I want you to be a regular little gentleman, Bruce," she had said. "You can be a good example to the other boys around here if you want to and it will help to make them better men," she advised as she stroked his hair caressingly. "And if they ask you to play a few selections on the piano, I want you to do so without being asked a second time. You are learning to play real well and when people have accomplishments they should give others the benefit of them."

To all of this, Bruce made no reply. He was thinking as to the advisability of telling his mother what he had promised Bill and Jimmy. "No, I'll wait," he said to himself. "If I mention it now, she may change her mind about going there tonight. I'll trust to luck and maybe she'll find it out while we are there. That will let me down a little easier at least," he figured. "She won't dare to raise much of a fuss about it in the presence of the Webbs. Wish Bill could be there," he thought. "That would give us a chance to get off by ourselves so that we could complete our plans."

It was nine o'clock of the evening referred to. Bruce and Jimmy had disappeared upstairs shortly after the Carters had arrived. No one seemed to think anything strange about that, for boys always like to be by themselves on occasions of this kind. And, of course, everyone thought that they were playing at some sort of house game. In fact they had not been very much missed by any one excepting Bruce's mother, until she called attention to the fact that the boys were very quiet about whatever they were doing.

"Oh, they're all right, Mrs. Carter," said her hostess. "Boys like to be by themselves and Jimmy is a great entertainer. I am sure they are not in any mischief."

"Well, it's so quiet up there, that I don't believe they are there," answered Mrs. Carter nervously.

"Surely they are," she was again assured, "and just to prove it and to settle your suspicions, Mrs. Carter, Jennie will go and see."

Jennie was Jimmy's big sister, at least she thought she was, although she was but two years his senior and it is needless to say that the relation between big sisters and little brothers is not always the best when it comes to matters of advisory nature. And Jennie was good at handing out advice to the other members of the family and at times she did not spare her mother and father. Tiptoeing up to Jimmy's room, she found it unoccupied and for the moment she began to think that Mrs. Carter was correct in her judgment. She searched the bed, both in and under. Then she tried the clothes closet, thinking that having heard some one coming, they might have hid there ready to spring out for the usual scare that boys delight in. Just as she was about to leave to report the result of her searches, something glued her to her tracks, for at that moment Bruce dropped the kerosene lamp of the incubator which he had been cleaning and down the attic steps it rolled.

The effect was all that any boy could have desired to produce upon his big sister. She let out a war whoop and down the steps she flew, back to the living room and protection. "I'm nearly scared dead," she gasped. "The boys are not there, but there's some one up in the attic," she said excitedly. "Something making an awful noise fell down the steps leading to Jimmy's room. Oh, it sounded terrible and I don't see how I ever got out of there alive, I was that scared."

"Why it couldn't have been anyone, silly," her mother urged, "unless it is the boys. But what would they be doing up there all this time. There's nothing of interest there."

Of course, Mrs. Carter was all unstrung, as you might suspect, over such an episode as this, and naturally she said a great many things without much meaning to anyone but herself. And it was only after Jimmy's father had returned from an investigation of the attic and reported the boys there safe and sound that she partially recovered herself. Mr. Webb laughed over it good naturedly, for it meant nothing more than a good joke to him.

"Those two rascals are overhauling that old incubator," he told them, "and the noise you heard, Sis, was made when Bruce let the lamp slip from his hand and it rolled to the bottom of the stairs. They are a sight," he grinned straight at Bruce's mother. "They've got themselves smeared with dirt from head to foot, just like a boy delights to be. They are having the time of their lives, and they say they are planning on going into the chicken business. What won't boys think of now days," he winked at Mr. Carter, who in response said: "Just like we were, Axtell, always into some mischief and always ready to be hailed into the court after they are convicted."

(To be continued)

Junior Letters

Hoard's Dairyman Juniors:—I live on a 150-acre farm in the eastern part of New York State along the Mohawk river. Our farm consists of about 20 acres of flat land along the river which is tillable and about 40 acres of clay which is tillable. There are about 30 acres of woods and the rest is in pasture. I quit school when I was in the first year of high school but am thinking of going to an agricultural school now. We set out over 5,000 cabbage plants last spring but they did not sell very well this fall so we fed them to the cows and they milked well on them. We have six Chester White pigs and 60 chickens and 4 horses. We have 13 cows of which 4 are fresh now and the rest will be by April. If any of the juniors wish to write to me my address is Pattersonville, New York. Frank C. Wilcox.

Hoard's Dairyman Juniors:—We are milking fourteen cows at night and five in the morning. Most of the hay in the barn is gone but we have some in stacks. A little over half of our silage is gone but our silo is just a ten by twenty. We have about one hundred sheep. We have eight horses and a pony. I am eleven years old and am in the sixth grade. Our teacher's name is Myrtle Dolan.

Wisconsin. John Holland.

Hoard's Dairyman Juniors:—I have 24 pet rabbits. We have 17 cows, 4 heifers, and 1 pure-bred bull and 4 horses. We had the champion herd in the testing association last year. I live on a 120-acre farm. I am 11 years old and I am in the 6th grade. We have a milking machine so I don't have to milk by hand. I have no brothers or sisters. It seems lonesome sometimes. My work on the farm is feeding the rabbits and chickens and helping to do the chores. In the summer time I clip the lawn and drive horses on the hay fork.

Wisconsin. Orval Hessel.

Hoard's Dairyman Juniors:—Well, I suppose you fellows have forgotten that I am still a junior but I am trying to be one. I am in the pig club, but the first part, the feeding contest, has closed and the sow and litter contest has begun. I won fifth in the breeding contest. I won first on the best kept record, first on the best essay, and tied for first on the cheapest cost of production, largest daily gains being my weakest point The club was composed of Duroc-Jerseys and Poland-Chinas. Mine was a Poland-China. Her name is Wagner Wonder Stamp. I think I will join a calf or poultry club this spring.

At present we are milking only four cows. They are Guernseys.

I would like to see more junior letters from Indiana in the junior department. I wish some of the juniors would write me and tell me how they are getting along in the club work. My address is R. D. 8, Mt. Vernon, Indiana. Carl Russell.

Hoard's Dairyman Juniors:—My pure-bred Holstein heifer freshened the 12th of January with a heifer calf. It is quite small but otherwise is well proportioned. She is quite a small cow but is giving about 25 lbs. milk daily I am feeding her clover hay, corn and pea silage for roughage and a mixture of 2 parts Queen Dairy Feed, 1 part bran, and 1 part ground oats.

Our cows are doing much better this winter than ever before.

The weather up here is fine, a little too warm for this time of the year and not enough snow. The cars are running between here and Barron right along.

We have two sows to farrow this spring and are feeding eight fall pigs. We were offered $30 for the eight pigs awhile ago.

Wisconsin. Paul Krippner.

Hoard's Dairyman Juniors:—I live on a 214-acre farm and go to school every day. I expect to pass the 8th grade this spring so that keeps me studying all the time. We have 15 head of cattle, four are registered Ayrshires. We are going to build up a herd of them. Papa bought a bull from Mr. Strubles in Ohio. He is a dandy and his name is Silverdale. We have four sows and nine horses. For pets I have one big tiger cat and a black dog I call Tony and a white rabbit. We keep 250 White Leghorn and White Wyandotte chickens. I have one sister and her name is Jessie. She is through school. I like to read the junior letters. I am 14 years old.

Papa bought twin Guernsey calves. One of them is mine. He said when it gets big I can sell it and put the money in the bank for myself.

Hoping some of the juniors will write to me, my address is R. R. 3, Oregon, Ill.

Frederick Clausen.

POSITIONS WANTED

Position wanted as farm foreman on dairy or general farm by graduate of Wisconsin Agricultural School. Can furnish best of references if required. Address MORRIS SHEA, Campbellsport, Wis. 8-3

Position wanted by single, middle aged man to care for cows, good with calves. D. G. CROWLEY, Camillus, New York. 9-2

Wanted—Position as farm superintendent, agricultural graduate. Always lived on farm. Prefer stock farm. Address BOX 686, care Hoard's Dairyman. 9-2

Wanted—Steady position on dairy farm April 1st by single man, age 21. Experienced, use no tobacco. References. Wages $65.00 month, board and washing. State privileges in first letter. GEO. RADER, care H. H. Webb, Mulkeytown, Illinois.

Wanted—Work caring for garden, lawn, etc., on large place. ALBERT KELLY, 153 East Terrace, Ishpeming, Michigan.

Married man with family wants position as herdsman or general farm work. Address BOX 215, Lake Mills, Wisconsin. 10-2

Young man wants position on dairy farm. Well experienced and good reference. State full particulars in first letter. Address BOX 695, care Hoard's Dairyman.

Position Wanted—As horse feeder by energetic young man, experienced in this line of work. Willing to learn anything new. Good references if needed. ROBERT N. HOFFMAN, care Cuttin's Farm, Downer's Grove, Illinois.

Situation Wanted—Farm superintendent and dairyman, married, American, 38. Well experienced in dairying and stock raising in all its branches including all kinds of power farm machinery. Can handle all the requirements of a private or commercial farm or institution of any size. Highest references for ability, character. Address SUPERINTENDENT, 4463 North Uber St., Philadelphia, Pennsylvania. 10-2

Wanted—Position by experienced reliable single man, age 24. State wages. C. H. KEENAN, Black Creek, Wisconsin.

Position Wanted—As manager, herdsman or will rent dairy farm on shares where cows are kept for profit and good care is essential. Address BOX 697, care Hoard's Dairyman. 10-3

Position wanted as farm manager by healthy single man, aged 42. 17 years' experience, 5 years with present employer. Can handle men and will work with them. Understand crop rotation, feeds and feeding and care of cattle, either dairy cattle or Shorthorns. Can produce good clean milk. Have made quite a study of the care and feeding of hogs, both for market and breeding. Also understand feeding chickens for egg production, care of sheep, spraying fruit trees, etc. Able to buy and sell, also able to stop the unnecessary leaks that occur on many farms. Will keep records and everything must be accounted for. Have read the best agricultural literature and studied it since 1903. Would like to make connections with a first-class busines man who would give me full charge. First-class reference from my present employer. Address LOCK BOX 334, Waukegan, Illinois. 10-2

Wanted—Position by married man to take charge of A. R. work. No tobacco used. State particulars in first letter. Address BOX 698, care Hoard's Dairyman.

Good steady position wanted on a dairy farm at once by two brothers 21 and 15. Have mother to keep house. In first letter state wages, privileges and conditions and if willing to pay moving expenses. WM. SCHULZ, 5844 Proctor Ave., Detroit, Michigan.

Wanted—Steady position on dairy farm or as milker of test cows. Age 30 years, life experience in dairying. Reference as to my milking ability. Wisconsin or California preferred. Also Catholic place preferred. GEO. J. HESSELBROOK, 2201 Selim Ave., Cincinnati, Ohio.

POSITIONS WANTED

Wanted—Position by married man on progressive Holstein farm. Good milker and years of experience with pure-bred cattle. Would like position as test cow milker, preferably in Michigan. Give particulars when writing. WARD W. BRONSON, Shepherd, Michigan.

Experienced, young, honest dairyman, wishes to correspond with responsible party. Best results. Also furnish all round man. JOSEPH ZIMMER, 85 Lee Street, Milwaukee, Wisconsin.

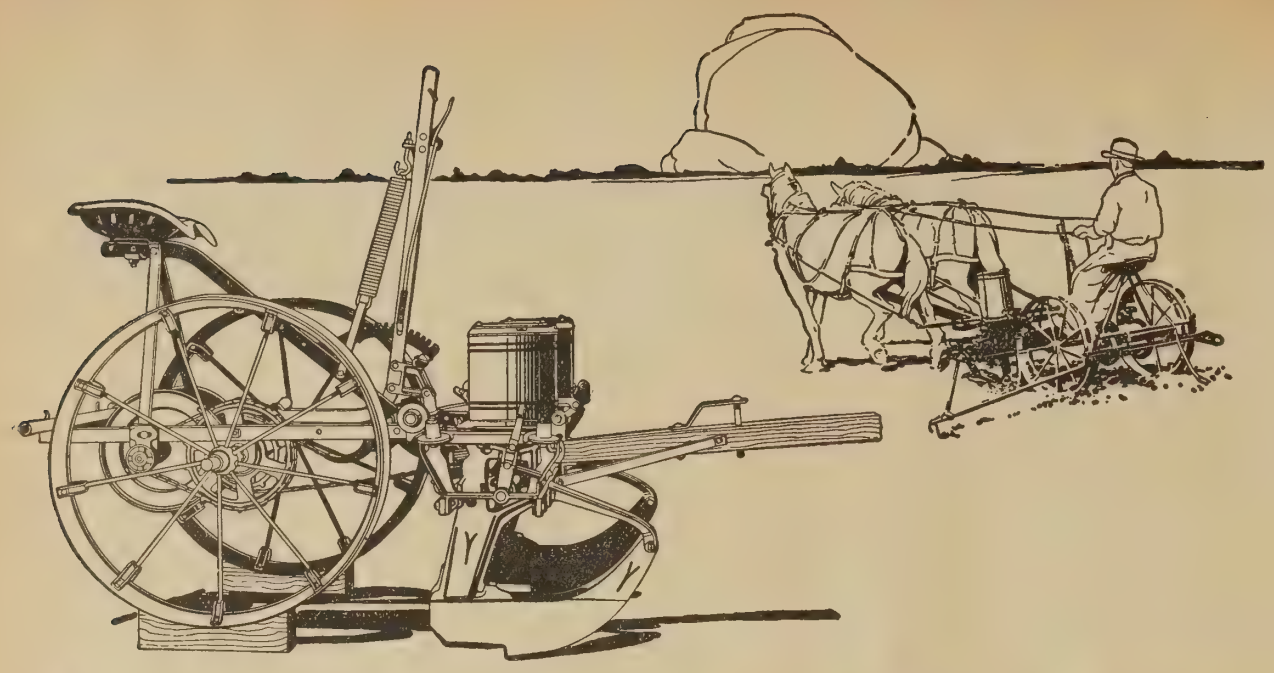
Wanted position as superintendent or foreman, on grain, dairy or stock farm by man aged thirty-five. Experienced on some of the best farms in Illinois. First-class buttermaker and best of references from former employer and county adviser. Address BOX 700, care Hoard's Dairyman.

Position Wanted—Single man many years in charge of dairy herds as milker, feeder and calf raiser. State your best proposition for attention, salary, board and room. M. L. RILEY, Barrington, Illinois.

Feeding or Breeding—Which First?

HOARD'S DAIRYMAN:—In speaking with a county agent recently concerning the introduction of pure-bred cattle into the county, one fact he emphasized was the need of better feeding methods. And he was right. If a farmer wants to lose money fast, buy high priced pure-breds, and then don't take care of them. Breeding and good feeding have so long been associated in the improvement of live stock that, if you take away the one, you lose the effect of the other. High milk production is a man created development, and, because so, it may be quickly lost. A common cow poorly kept will serve you better than a pure-bred improperly housed and fed. On the other hand, feed them both intelligently and they will both do better; but the pure-bred animal will simply run away from the poorer cow in returns per dollar of feed fed.

But, you say, will not the farmer who puts good money into the better bred animal be encouraged to feed better? Will he not provide better housing, better care, a better balanced ration, more skillful handling? Has he not put more money into this kind of live stock, and will not his interest be greater, resulting in better care? In rare cases, yes, but in the majority of cases, no. The habits of feeding of years may not be changed so radically and in many cases results have been little short of disastrous. It is the poorly fed pure-bred that has kept many more from using better blood, better breeding.



When May a Farmer Buy Pure-bred Cattle?

It would seem wise that before one purchases pure-breds he should have at least foundation for good feeding, I mean good silage and good clover hay with alfalfa as an insurance against clover failure, or possibly other protein feeds upon which he can depend. Given good silage and good alfalfa hay it is hardly conceivable that he can have very poor cattle of any sort about the place. Surely it is not too much to ask that he have this necessary feed before he enters into the production of pure-bred cattle. In other words, if you cannot and do not keep common stock well, the chances are you will not succeed with pure-breds.

This county agent was right. It is not alone better live stock we need. What we really need is better feeders. In rare cases does the purchase of pure-breds make a man a better feeder; but cases may be multiplied where the liberal feeder of home grown feeds carefully stored qualifies as a feeder of the more highly organized pure-bred.

Minnesota. JOHN BAUER.

What the Corn Planter Does is Final

A GOOD stand means extra bushels per acre—and that's what makes your profits, always. You can't get a better stand than your planter permits. If it is inaccurate, it covers up its mistakes as it works. They are not visible until the plants come up and hills with too few or too many stalks show you how your planter failed you. It is too late to overcome the mistakes then. You cultivate the crop, harvest it—spend just as much time and labor on it as you would on a full stand—and get fewer bushels per acre and smaller profits. Be sure your planter is accurate.

JOHN DEERE
999 CORN PLANTER

You can feel perfect assurance that the desired number of kernels is being dropped in the hill when you use a John Deere 999 Corn Planter because it is a natural drop—just as accurate as hand planting—"Natural Cell Fill, edge-delivery seed plates" and sloping hopper bottom—kernels enter the cells in a natural position—not forced—one to each cell and the right number accumulated and checked in the hill.

The highest degree of accuracy is maintained not only when the planter is new, but year after year by the John Deere No. 999 Corn Planter. Repeated tests have proved this. Over fifty years specializing in the manufacture of corn planters has enabled this factory to develop such a planter, and each and every one must pass an accuracy test before leaving the factory.

The Variable Drop Device—a great feature—enables you instantly to change the drop to meet the various conditions of soil in the same field. By merely shifting a foot lever, without stopping the team or leaving the seat, you can vary the drop to two, three or four kernels per hill—always exactly the number desired.

Change from hilling to drilling or vice-versa made instantly by means of foot lever. Nine drilling distances can be secured without changing plate.

Plants great variety of seed without changing cut-off.

Automatic Marker requires no attention after starting in the field.

Fertilizer and Pea Attachments can be furnished—either one or both can be used when planting corn.

FREE BOOKS—"More and Better Corn"—Tells how to select and test seed corn, how to plant, when to cultivate.

"Better Farm Implements"—114 pages, illustrates and describes not only corn planters, but every one of the leading John Deere farm tools—plows, harrows, drills, hay tools, grain and corn binders, shellers, elevators, tractors, engines—also other information of value to you—a reference book you will be pleased to keep on your table. Write today for a copy, address John Deere, Moline, Ill., and ask for package P-414.

Grow More Clover Seed

(Continued from page 408)

ground is dry enough to drive over. The wheat is injured but slightly.

When the drill is used, from 5 to 6 pounds per acre are required. For broadcast seeding from 7 to 9 pounds are required. Putting in the seed with a disc drill would undoubtedly be the most economical way.

Clover Insects and Clover Diseases

Clover like other farm crops is not free from disease or insect attack; there is a considerable loss from these attacks yearly. Frequently near harvest time there is a general blighting of the clover. This is caused by the anthracnose disease. As a rule, these attacks reduce the yield and affect the quality of the hay. So far practically the only control remedy is to maintain a good rotation of crops or to plow the infested clover under as soon as the first crop is removed. It is probable that anthracnose spores would be carried through the manure back into the soil again, but so far this has not been the case in practical experience. Neither would it be justified to destroy a crop of clover hay to control the anthracnose alone.

Root rot is more dangerous than anthracnose. It is a soil disease particularly and leaves the clover field full of bare spots after its attack. The individual plants rot off just under the ground and tops of them dry up. Definite crop rotation is an aid in controlling this disease and if the outbreak is severe it is best to plow the first crop under deeply. Or, if the disease appears late in the fall, the ground may be plowed immediately for corn, the idea being to keep the clover out of the soil as long as possible without interfering with the rotation. There is probably no relation between the root rot of clover and the root rot of corn.

Clover is attacked by a number of insects, particularly the clover leaf weevil, clover seed midge, clover seed caterpillar, and clover seed chalcid.

For the clover leaf weevil there is no distinct control, but a fungus disease is known to kill the larvae to some extent. Spraying with arsenicals is hardly practicable.

With the other insects mentioned an effective general control consists in cutting the clover in early June. This practice serves a double purpose of destroying the larvae of the insects in the clover and also makes it possible for the second or seed growth of the clover to get a good start. Early cutting of clover then is an effective management in the control of clover insects.

Clover Seed Harvest

Practically every farmer in our section realizes that it is necessary to cut the first crop of clover early in order to produce a good seed growth. Where the land has been limed and acid phosphate used regularly in the rotation a good growth of aftermath will come on quickly unless the season is unusually dry.

Some farmers make it a practice to pasture the crop during the spring, harvesting the clover with live stock and then allowing the second growth to produce the seed. The fields are clipped sometimes and the seed crop has a better chance than if a complete hay crop were removed.

Where farmers have too many acres of clover for hay the peak end of the clover harvest could be handled in this manner. However, it seems possible to produce a fair crop of clover seed after a first crop has been removed. Early cutting of the first crop is so necessary, however, that it is nearly always essential to sacrifice the hay crop to some extent.

Substitutes for Clover

No crop discussion seems complete unless a list of substitutes is given. For red clover we have the principal substitutes: alsike and mammoth clover.

Alsike has some advantages over red clover in that it will thrive in wet and acid soils. The seed being small, about half smaller than clover, goes farther in seeding an acre, only about half the amount being required. The seed is usually not as expensive as red clover, but this year the quotation runs almost as high.

Alsike produces but one crop, however, and has no second growth. It does not yield as heavily as red clover usually, but it is not so susceptible to anthracnose nor root rot and makes a desirable legume substitute where these diseases affect the clover crop.

Mammoth clover surely deserves more consideration than it gets as a corn belt crop. It produces heavy yields on acid soils and seems fairly immune from disease and insect attack. Because of its rank growth, the stems are somewhat woody, but if cut and cured in the full bloom state it makes desirable hay. It requires more skill to handle big clover successfully but no farmer should allow this legume to escape his attention if he cannot grow alfalfa or red clover easily. Mammoth clover is quite beneficial as a soil improver.

How about flowers around the house? The hardy perennials have many advantages, but the easily grown annuals are not to be despised.

Sunshine and fresh air are good disinfectants.

Dairying in England

(Continued from page 407)

to some of the large English centers.

In spite of this trade England is famed for its cheese. There are perhaps forty varieties of cheese indigenous to England but the best of them all is the famous blueveined Stilton. It takes an artist to make a good one and Stilton-skill is hereditary. These cheese are generally farm made and on a few farms Stiltons have been made continuously for over three centuries. It is perhaps well to state that in some of those places the descendants of the original makers are still employed and that they are using the dairies in which their forefathers worked.

The other cheese vary greatly in type and popularity. The Cheshire is the most important and the dairymaids of the county of Cheshire, where it originated, are perhaps the best cheesemakers in the world. Other pressed cheese of less importance than the Cheshire are the Derby, Leicester, and Gloucester, while the soft cheese are legion.

England has still much to learn regarding up-to-date methods of dairy farming and, though the Englishman is slow to move, there are symptoms of his awakening. Improved methods of production and distribution of milk coupled with the well established cheese industry would render England much more independent of foreign sources for her supply of dairy products.

Barn at Home for Dependent Children, Wauwatosa, Wis.

Barn of C. D. Austin, Lake Mahopac, N. Y.

Two barns—different in size, the same in roof integrity

GEOGRAPHICALLY, the owners of these two barns are far apart—Wisconsin and New York.

In business judgment they are right under the same roof.

Each has chosen a roof of Johns-Manville Asbestos. One preferred roll roofing and the other shingles*—*but they both chose asbestos.* They realize the *real economy* of Johns-Manville Asbestos Roofing, either in shingle or roll form.

Roofing economy is not to be measured by first cost, but by total cost over a long period of years. Although the first cost of Johns-Manville Asbestos Roofing is slightly greater, first cost is practically the only cost because Asbestos Roofing, being all-mineral, will last as long as the building it protects.

Balance the first cost of Johns-Manville Asbestos Roofing against the initial cost of cheaper roofings, plus repairing cost, plus painting costs (Asbestos Roofing needs no painting to protect it), plus renewal costs, and you will find an overwhelming balance in favor of Johns-Manville Asbestos Roofing.

A roof of rock

Asbestos rock is blasted from the earth, where it has resisted the destructive forces of Nature for centuries. So, Asbestos Roofing is virtually a roof of rock.

Of course Asbestos Roofing is fire-proof—that word has become almost synonymous with the word "asbestos."

The Underwriters' Laboratories, Inc., give to Johns-Manville Asbestos Roofings the highest ratings.

The singularity of Johns-Manville Asbestos Roofing is not its fire-safety, or its economy, or its weather-resistance, or its durability. Its singularity lies in the fact that all these qualities are combined in their fullest measure, in this one roofing.

Re-shingle for the last time

If there are any shingle roofs in bad condition on your farm, you should talk to your carpenter about Johns-Manville Asbestos Shingles. They can be laid right over the old wooden shingles.

In this way you save not only the labor and expense of tearing up the old roof but you have the additional insulation and protection that the old shingles afford as a base for the new and permanent roof of Asbestos Shingles.

And best of all, you are never bothered by roofing troubles again.

The Johns-Manville Asbestos Roofings are made in various weights of Ready Roll roofing, in Shingles, in Built-Up form for flat roofs or Corrugated for skeleton frame buildings.

* *These Johns-Manville Asbestos Shingles differ from all other Asbestos Roofings in the fact that each shingle is a separate slab of permanence—imperishable asbestos and tenacious cement united under a tremendous pressure. They make a roof of beauty and everlasting service.*

JOHNS-MANVILLE Asbestos Roofing

The Watertown, Wis., Sale March 29th and 30th

Offers a big opportunity for farseeing Holstein enthusiasts. We have **130 Head of Selected Registered Holsteins**—Holsteins that are sure to do for you what our offerings have done for many in the past—started them right. And remember that the start determines your future in the work.

When you go out to buy Holsteins you stand at the fork in the road—spelling both success and failure. Take the path that leads to Watertown, next Tuesday and Wednesday—the road that always insures prosperity to black and white admirers.

We are Consigning to the Watertown Sale—

Two Daughters of Spring Farm King Agatha Pontiac and One Son of King Agatha Pontiac Lass

No. 1. **Harvest Agatha Segis**—This is the handsomest heifer we ever sold from the farm. She will be fresh in May and is in excellent condition for testing. Her dam combines the best blood of Wisconsin with that of Judge Beets Segis. She was born in March, 1919; is due in May to our son of Matador Segis Walker.

No. 2. **Harvest Agatha Pietje**—A full sister to the good heifer bought by Axel Hanson at the State Sale last year. She is a little thin at present and is also bred to Harvest Matador Segis.

No. 3. **Harvest Korndyke Pietje**—A prize winner at the Wisconsin State Fair in the big junior bull class last year. We believe he will go higher in the same show next year. One of our breeders young herd that was second at the same show. Just about ready for light service. All sold under 60-day retest guarantee.

HARVEST FARMS, Mayville, Wis.
J. P. Riordan, Manager

Dodge County Spring Brook Farms —Burnett, Wis.

Offer in the Watertown Sale two choice females, young cows, in calf to Hunter Bros. famous son of Champion Echo Sylvia Pontiac and out of that well-known 37-lb. daughter of Belle Model Johanna 2nd, likewise 37 lbs. These good cows, both individuals of merit and splendidly conditioned, are A. R. O. performers, one having a record of 25 lbs. at three years (sired by Mr. Moscrip's 30-lb. son of Canary Paul Fobes Homestead) the other a 19-lb. three-year-old whose pedigree is replete with good yearly records. You'll single out these cows in the sale barn and make up your mind that they are the kind of foundation stock that will get you "there."

Spring Brook also offers a vigorous, well grown yearling bull sired by their son of Sir Piet. and out of the last State sensation heifer that made 30 lbs. at three years of age and has now come back and in 365 days completed as follows: 1,010 lbs. butter from 20,010.08 lbs. milk. How often has a Wisconsin Sale Co. placed at your disposal a bull of like merit?

Look up Spring Brook's Consignment When You Get to Watertown, March 29

O. H. Erdman, Juneau, Wis., Consigns

DAM OF BULL

RACHEL HOMESTEAD DE KOL PIEBE
Butter 5 yrs..... 30.00
Milk 586.70
2 A. R. O. Daughters

A 31-lb. son of his senior herd sire—a 33-lb. son of King of the Sadie Vales, a combination representing some of the very best breeding obtainable. The dam of this yearling bull is a rare thing, individually. Some of our most competent judges have declared her to be an outstanding individual—a genuine show cow. The sires and dams back of this fellow are all individuals of recognized Holstein type. He himself is positively one of the "typiest" bulls we have ever offered. So if you are emphasizing the individual in your breeding operations this bull should interest you. Type resulting from type is the one safe "bet" in the hazardous work of producing individuals.

Mr. Erdman also offers a 24-lb. cow of large frame, making 800 lbs. butter on yearly work, a granddaughter of Fobes Tritomia Mutual De Kol; a six-month-old calf of good type whose pedigree is replete with popular breeding. Another offering worthy of mention is a yearling son of a 16-lb. two-year-old, now making around 25 lbs., her dam has 27 lbs. from 619 lbs. milk, her second dam 31.25 lbs. butter from 721 lbs. milk. This bull is sired by the Sadie Vale bull mentioned above. Remember that Mr. Erdman has one of Dodge County's choicest herds; that practically all the females are being urged in long and short time work. When you purchase his offerings he continues to make them more valuable to you in the further development of his herd.

Haeger, Mack, Edwards—Auctioneers

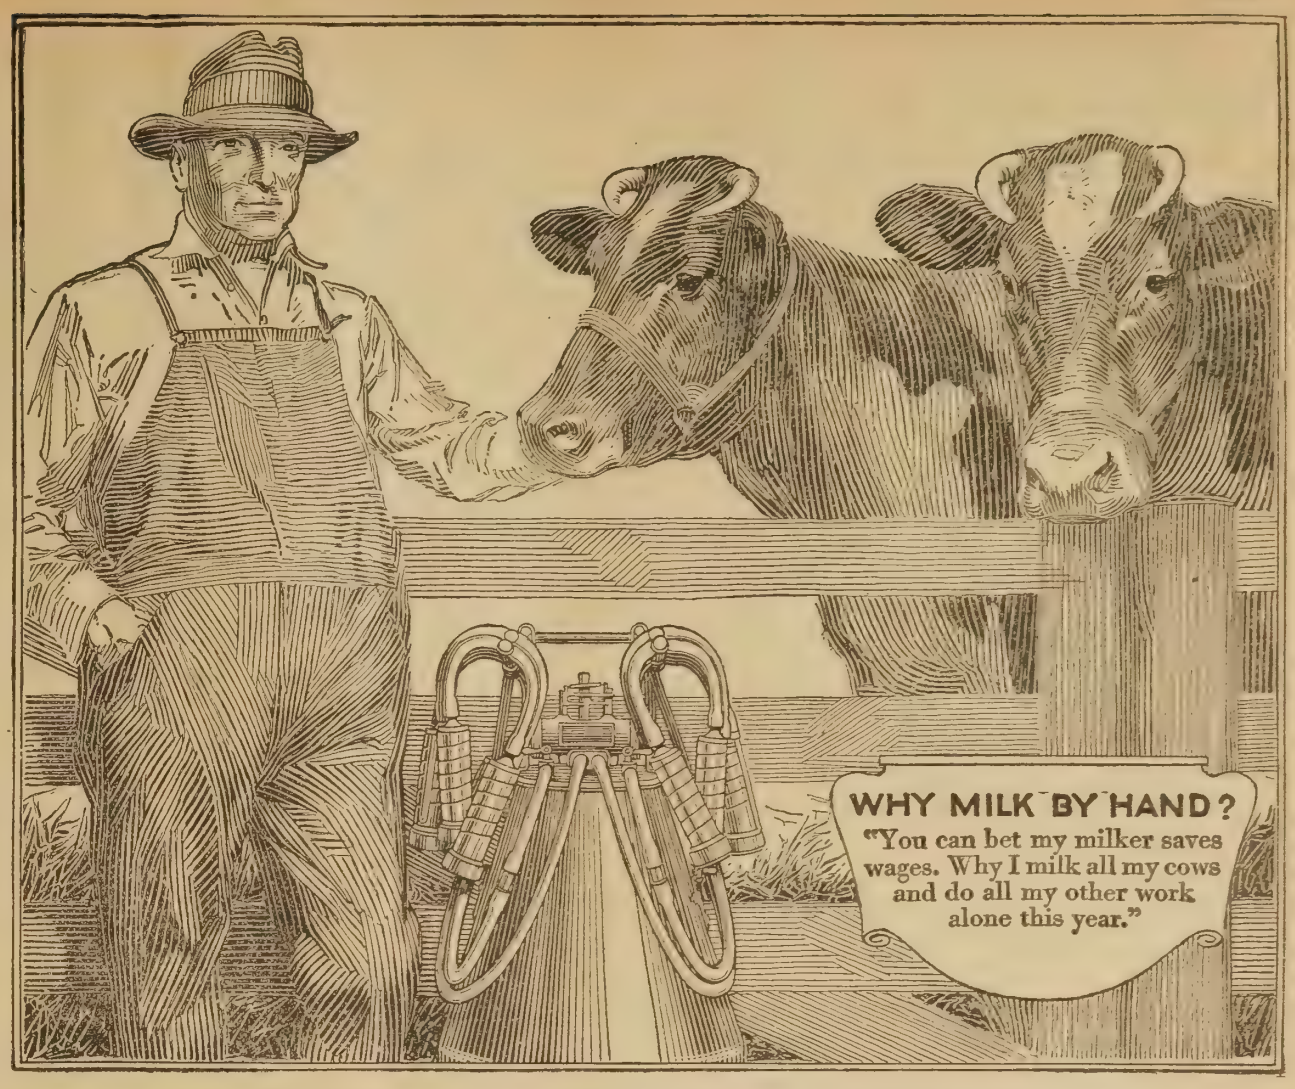
Watertown Holstein Sales Co., Francis Darcey, Sec'y

Value of Fanning Mill on the Farm

HOARD'S DAIRYMAN:—The farmer this year needs to use the most efficient methods and employ the best farm practices, so that he may reduce the cost of production of crops and things he has to sell from the farm in order that he may increase his net income. In other words, he must plan wisely and give more attention than ever before to stopping small leaks in his farm operations.

There is probably no farm practice that is being more ignored or underestimated than the seeding of good, clean, vigorous farm seeds of high germinative power. Too often poor, unclean mixed seeds, contaminated with weed seeds, are being sown on good, clean soil and poor results follow. With seed grain it is as with animals, if the parent is healthy and strong, the chances are the offspring will generally be the same. Therefore, select kernels that are plump, heavy, and free from weed seeds and disease, for seeding. The probabilities will be, everything else being equal, that a good crop of good quality and yield will be raised.

Test With Fanned Oats



The writer made a test some time ago as to the value of growing cleaned seed oats as against uncleaned oats. The purpose was to determine whether or not additional quantity and quality of oats would be harvested from the cleaned oats over the uncleaned sown just as it came from the threshing machine. A good fanning mill was provided and two men engaged to do the work. It took the two men two hours to fan the oats twice with the use of the fanning mill. Twenty-five bushels of oats were so cleaned. Each man was paid forty cents an hour, representing an expense of $1.60 for the two men, plus the use of the fanning mill. Allow in this instance $1.00 for the use of fanning mill, making it a total expense of $2.60 for the work.

The fields that both the cleaned and uncleaned oats were seeded on were side by side and practically had the same kind of soil, same drainage, and same state of fertility. The oats in the one case as well as in the other were seeded the same day at the rate of two and one-half bushels to the acre, ten acres being devoted to the cleaned and like number of acres to the uncleaned.

After the grain sprouted in the field, it represented a wonderful object lesson. Later, under adverse conditions of weather, the weak, shriveled seeds produced weak plants, many turned yellow and disappeared, while the strong, heavy seeds produced strong plants and grew well. The uncleaned oats apparently were more susceptible to oat smut disease than the cleaned. At threshing time the cleaned oats yielded seven bushels more to the acre than the other. Figuring the price of oats at sixty (60) cents per bushel, the price paid at that time, meant an increase for the ten acres of $42 over and above what was raised from the uncleaned oat field.

Subtracting the total expense incurred in cleaning the oats left a net income of $39.40. Not only was there the increase in yield but the oats was of better quality as well. A farmer cannot do anything better at this time of the year than clean his seed grain. Secure the heaviest, plumpest kernels, and only sow the cleanest and the most vigorous seeds. A man with a good level head and a good fanning mill are indispensable.

Wisconsin. J. F. WOJTA.

"The machine made it possible for me to do my work alone this year and more than paid for itself in the savings of wages this summer." —WILL HANEFELD.

How Perfection Pays For Itself

NO doubt you have often thought, "If I could only do the milking I could get along with less help or even do my work alone." Here's the opportunity to put that thought into action. Get a Perfection and you can do your work with less help or alone.

One man with the Perfection can milk the same number of cows as three hand milkers. You can easily milk 24 to 30 cows an hour with the Perfection Milker

Thousands of owners say that Perfection easily pays for itself in less than a year on wages saved. But more than this the Perfection is unusually low in upkeep and costs but a few cents a day to operate.

Furthermore owners say, that their cows give more milk when milked with the Perfection. Cows like the Perfection's natural action. It's just like their calf's milking.

You are paying for a Perfection every year in wages to hired men —why not have it?

Send For Catalog

Send for your free copy of our book, "What the Dairyman Wants to Know." It answers every question about milking machines. At the same time we will send the names and addresses of Perfection owners near you. Why Milk By Hand? Perfection milking is more profitable.

PERFECTION MILKER

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Treatment of Barren Cows

HOARD'S DAIRYMAN:—Breeders of pure-bred dairy cattle are increasingly concerned over the question of barrenness and sterility. It not infrequently happens that a valuable cow, especially after she has been through a hard "grind" in connection with an A. R. record, absolutely refuses to get in calf.

In the past a breeder who was unfortunate enough to have such shy breeders in his herd, usually gave up after a perfunctory effort to get the cow in calf. At present, however, he has been sufficiently encouraged by a number of successes to make a harder effort.

One reason for this change is that the rapidly expanding pure-bred business and the increased money value of many cows has made it possible for practicing veterinarians to specialize in this type of cases. The experiment stations have also done considerable investigational work, mostly in connection with veterinarians in the field.

One of the most successful practitioners in Wisconsin declared recently:

"We all have a lot to learn about these diseases and the more I see of them the less I feel I know. Some cases that appear hopeless respond very nicely to treatment, while others that appear very hopeful in the beginning prove hard to treat and never recover."

In a study on sterility, by Hadley and Stadler, of Wisconsin, it was found to be caused mainly by secondary genital infections. Several different kinds of micro-organisms were found in the cases studied. In many cases abortion is a great cause of this sterility by lowering the animal's vitality and consequent inability to resist the encroachments of disease. Any experience which materially reduces a cow's vitality would materially promote infection.

These secondary organisms which cause sterility are usually of low vitality. They have been isolated, and "bacterins" have been prepared for the purpose of treating infected cows. The giving of these bacterins, supplemented with irrigations at regular intervals of Lugol's solution of iodine, has usually caused a rapid change for the better, purulent discharges disappearing almost entirely. At present this treatment is rather limited in scope, and not available to many veterinarians because they lack the proper facilities to carry it out.

Veterinarians of considerable experience also report that frequently this sterility, especially in the case of heifers, is due to cysts and other physical obstructions which are easily removable. The first examination should always have in mind the possibility of these obstructions.

Wisconsin was the first state to recommend the irrigation of infected organs with a one per cent solution of common salt. This treatment is now being given by many veterinarians and farmers with most excellent results.

The field opened up by the use of "bacterins" is being thoroughly studied and really offers good ground to hope that we may soon be able to control or cure these cases of sterility in a greatly increased number of cases.

Wisconsin. W. A. FREEHOFF.

Swelling

I have a 4-year-old horse with the ankle on the hind leg swollen badly. It happened when the colt was two years old while running on pasture. Some of the old-timers call it milk leg. Kindly advise treatment.

South Dakota. SUBSCRIBER.

In "milk leg" (lymphangitis) the swelling starts in the groin and works downward. The cause is overfeeding during idleness of one day or more and repeated attacks may leave the fetlock joint permanently enlarged. If the enlargement or swelling has been there for two years, as we understand from your account of the case, the condition is incurable.

Abortion

1. Suppose one sells out all his cows and bull, having contagious abortion, and buys healthy cows, will the healthy ones contract contagious abortion from fences, posts, straw, litter, hay, drinking tanks, stalls, halters, stanchions, stables—where the diseased cows once were?

2. Will hogs around cows having contagious abortion contract the disease?

3. Is the ordinary verterinarian in country towns competent to make a correct diagnosis of contagious abortion—bacteriologically?

4. If women use milk from cows diseased with contagious abortion, is there a possibility of transfer of the disease to them?

5. Will the bacteria live in chickens or are they too warm blooded?

6. Is Dakin's solution good for contagious abortion?

7. Is it possible to free a cow of contagious abortion so there is no question about her being cured?

8. Is there an easy test for contagious abortion so that one can ascertain the disease before he buys a cow and before he suffers the loss of finding out that a cow cannot have a calf?

9. Can one buy heifer calves from herds where contagious abortion may exist among some cows and be sure that the calves are not diseased?

10. Does not contagious abortion sooner or later spoil the community bull idea?

Idaho. T. T. K.

Read the articles on abortion in this department of our issues of January 7th and 14th, 1921.

1. Yes. Loose trash has to be destroyed or deeply plowed under and all places occupied by affected cows cleansed, disinfected, and white-

BAG BALM
MADE BY THE KOW-KARE PEOPLE
- in every cow barn

To keep your dairy on a maximum paying basis, look first to the health and comfort of the udders and teats. The slightest discomfort in these milk-giving organs reduces the yield, makes milking hard and encourages more serious ailments. Thousands of dairymen are keeping their cows comfortable and at full production through the use of Bag Balm for any disorder of udder or teats. Cuts, Chaps, Scratches, and inflamed or irritated conditions respond quickly. For Caked Bag, Bag Balm is without an equal. The tissues quickly return to normal upon application of this soothing, penetrating ointment.

A big package of health insurance at a little price. 65c at general stores, feed dealers and druggists. Be sure to keep it on hand; it pays for itself many times over.

ABORTION IN CATTLE
CAN BE TREATED SUCCESSFULLY AND
YOUR COWS MADE PROMPT, REGULAR BREEDERS BY
STERILOID

STOP LOSING CALVES
TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for **FREE BOOK.** It explains the causes and symptoms of Abortion and tells how to treat Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.
GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00 plus 4c tax. Mailed Postpaid, in plain wrapper.
MARTIN REMEDY COMPANY, Dept. A, 398-408 Columbus Ave., New York City, Reference—Colonial Bank.

washed. Fences and fixtures should be treated in the same way.

2. No; but sows also abort from germ infection peculiar to swine.

3. Blood tests should be made by pathologists or bacteriologists of an agricultural experiment station. The local veterinarian should take and forward samples of blood but rarely is equipped personally to make the laboratory tests.

4. There is such a possibility but corroborative evidence is lacking.

5. No.

6. Yes; but hypochlorite or hychlorite solution is readily prepared and effective.

7. No specific remedy has been found.

8. The blood test determines presence of infection but does not prove that the affected cow will abort.

9. Yes; if the blood test fails to show presence of the infection.

10. It is possible to keep the bull disinfected so that he will not communicate infection provided he is not allowed to serve a cow that has aborted or that has an abnormal vaginal discharge or that has constant or irregular periods of heat.

Double Returns from Farm Manure

(Continued from page 425)

ment, corn yielded enough more on the land where the manure had been supplemented with commercial fertilizer to pay for the treatment. The next year the profit from the use of the fertilizer in addition to the manure was represented by an increase in the yield of wheat of five and one-half bushels to the acre. Again, the harvest of the clover hay during the third year following the treatment showed an increase of 1,100 lbs. to the acre to the credit of the fertilizer. Similar results from the use of fertilizer to stretch the home grown fertilizer of the farm were secured by the Missouri Agricultural Experiment Station. The authorities of this institution, however, found that it was better to apply the fertilizer separately rather than combined with the manure, as is recommended in Ohio. In Missouri the fertilizer is applied part to corn and part to wheat at the time of seeding. The farmyard manure is plowed under for corn and used as a top-dressing for wheat.

Any and all of these ways of making the most of farm manures and crop residues are worthy of being put into practice and there is absolutely no doubt that if all were utilized, double returns or better from the plant food they contain would be enjoyed.

Two New Silver Medal Jersey Bulls

Two imported Jersey bulls have qualified for the Silver Medals awarded by the American Jersey Cattle Club. These bulls are Imp. Whitie's Majesty, owned by Quechee Fells Farm, Vermont, and Imp. Financial Baron, owned by A. F. Chaffee of Colorado. These medals are awarded to bulls having daughters to qualify with good records and which calve within a certain time. The first five daughters of Imp. Whitie's Majesty entered on test as junior two-year-olds averaged 8,824 pounds of milk containing 572 pounds of fat.

Fewer Cows, More Money

"Three years ago," says D. A. Wicks of the Unity, Wisconsin, Cow Testing Association, "we got our first cow testing association and I soon found my system of feeding was entirely wrong, also that I had several cows living on me. I disposed of the poor cows and fed the other cows better, and at the end of the year I had made more clear money than I have had any one year before."
